ECONOMIC TABLES

(TABLES B-I PART B & B-III TO B-V)

PREFACE

EARLIER in our Part II-B(*i*), we had presented information on Workers and Non-workers in Rajasthan according to main activity classified by sex and age-groups at the State and district levels separately for their total, rural and urban areas. This information, which was presented at full count basis, was also given in a separate table for various cities and towns in Rajasthan.

Quite a large number of other economic tables were, however, developed on sample basis which form the subject matter of our present Part II-B(*ii*) of the 1971 Census. The material being rather large, it is being released through four separate books of convenient sizes.

The present book, the first in the series, furnishes interesting information on the marital status and age-groups of female workers and non-workers according to main activity at the State level. District level classification of workers & non-workers according to main activity by educational levels in urban areas and also in rural areas; District level industrial classification of persons at work other than at cultivation as main activity by sex and Division, Major groups and Minor groups; State level industrial classification of workers in manufacturing, processing, servicing and repairs on household industry basis as main activity by sex and class of workers; State level classification of workers in non-household industry, trade, business, profession or service as main activity by class of workers, age and sex; District level industrial classification by sex and class of workers of persons at work in non-household industry, trade, business, profession or service as main activity; State level occupational classification by sex of persons at work according to main activity other than cultivation; and lastly, State level occupational classification by sex and class of workers in non-household industry, trade, business, profession or service as main activity. A note on the Sampling procedure is also given.

Several persons in this office have laboured hard to prepare this volume. The tables have been processed under the care of Shri R. C. Bhargava, Investigator. The list over-leaf mentions the names of such other officials who had helped to bring out this material.

Note on the Sampling Procedure

Sample Size : From the individual slips relating to the rural parts of a Tehsil/Anchal/Police Station, 10% sample of the slips was selected linear systematically with a random start. In the urban part of the district a 20% systematic sample of the individual slips was selected with separate random start. The sample sizes were adopted on consideration of required precision, available resources and operational convenience.

Selection procedure : The sample design adopted in 1971 census was stratified systematic sample of individual slips. For the purpose of sample selection, each district was divided into three sub-regions as follows :—

1. Tehsil (Rural)
2. Non-city Urban district
3. City (Urban unit with 100,000 & above population).

These sub-regions were termed as operational units if, however, any of the operational unit was unduly large it was divided into sub-operational units of at least 20,000 persons. Similarly, small-sized operational units were either clubbed together or tagged on to a contiguous larger unit so as to form an "effective operational unit" of the required minimum size. Adoption of these operational units ensured accuracy in sample selection maintaining at the same time stability in the sampling fraction within the tabulated areas. The procedure adopted has ensured effective control over sample selection within each block, as also in the entire operational units.

For the purpose of the Primary Census Abstract (PCA) the individual slips were sorted out according to ten broad industrial categories and nine broad age-groups for each of the sexes. The ten industrial categories of workers were as follows :—

Category :

I	..	Cultivators
II	..	Agricultural labourers
III	..	Livestock, forestry, fishing, hunting and plantations, orchards and allied activities
IV	..	Mining and quarrying
V(*a*)	..	Manufacturing, processing, servicing and repairs in *household industry*
V(*b*)	..	Manufacturing, processing, servicing and repairs in *other than household industry*
VI	..	Construction
VII	..	Trade and commerce
VIII	..	Transport, storage and communications
IX	..	Other services
X	..	Non-workers

The nine age-groups into which the slips belonging to each industrial category were sorted, were 0—14, 15—19 20—24, 25—29, 30—39, 40—49, 50—59, 60+ and 'age not stated'. Thus, the individual slips of a particular operational unit were sorted out in $11 \times 9 = 99$ cells separately for males and females. Sampling was done in each of the operational units independently by taking separate random starts. The slips were then distributed into 10 (or 5) pigeon holes for Rural (Urban) samples and one pigeon hole was selected at random, the slips falling in the selected pigeon hole constituting the sample. For the operational details of the sampling procedure and instructions, 'Manual of instructions on sorting, compilation (manual processing) & sampling procedures' may be consulted.

Estimation procedure : The tables prepared for each of the Districts/States from the 10% rural and 20% urban sample slips have been inflated to give the final estimated tables. Estimates have been obtained by making use of the cell frequencies (usually labelled as 'controls') available from the tables prepared on full count basis, namely, PCA and B-I Part A.

In order to ensure maximum possible inter-table consistency, it became necessary to use the estimated frequencies of a few of the final tables as controls for estimating some cell frequencies of other tables.

This way of estimating the cell frequencies ensured marginal totals of estimated tables tally with that of the full-count tables. This is convenient to the user, because after adjustment, the identical marginal totals are found in tables having the same marginal specification. "The adjustment diminishes the sampling variance to some extent; the more the controls the smaller the sampling variance of the adjusted frequencies[1]". Further, adjustment to known control totals has at the same time the effect of eliminating biases in the nature of inherent differences between the sample and complete count.

For the purpose of estimation of final tables, a set of multipliers was prepared for each table. A multiplier is the ratio of full count frequency of some characteristics from PCA or Table B-I Part A (or some estimated frequency from some already estimated table) and the corresponding sample frequency of the same characteristics from the sample table. The following statement gives the level of presentation of the tables and the related controls on which the multipliers are based. The details will be presented in the report on sampling procedures to be published later.

Reliability of the estimates : No exact formula can be given for the precision of the estimates in view of the systematic sampling design adopted. A very rough estimate of the relative standard error on the basis of simple random sample may be estimated as $\sqrt{(1-f)\frac{1-p}{np}}$, where 'f' is the proportion sampled (0·10 in case of rural areas and 0·20 in case of urban areas) and 'p' is the estimated proportion in any cell and 'n' the sample size, being euqal to 10% of individual slips in rural areas and 20% in urban areas. The size of the universe for the various values of the proportion from 0·000001 to 0·9 by percentage relative standard error shown in table I and II will help in deriving quickly an idea of the level of precision of any cell. Since in the present census, slips were sorted by sex, industrial category and age-group before sampling, it is expected that the efficiency must be considerably higher than a simple random sample of identical size. Extensive studies conducted have indicated that systematic sampling of individuals is more efficient than random sampling specially when the slips were pre-sorted for most of the socio-economic characteristics covered in a census[2]. Thus the estimates prepared on the basis of the systematic sampling in the present census can be expected to be quite reliable. Hence the standard error indicated by the table should be treated as an upper limit.

TABLE B-I PART B

FEMALE WORKERS AND NON-WORKERS ACCORDING TO MAIN ACTIVITY CLASSIFIED BY MARITAL STATUS AND AGE-GROUPS

THIS TABLE, which is an innovation of 1971 Census, gives the distribution of female workers and non-workers according to their main activity, further classified by marital status and age-groups. The data is presented at the state level separately for total, rural and urban areas.

It is felt that with the increasing participation of female workers in the country's economy, this information will be of great interest.

TABLE B-III PART A

CLASSIFICATION OF WORKERS AND NON-WORKERS ACCORDING TO MAIN ACTIVITY BY EDUCATIONAL LEVELS

THIS TABLE, prepared at the State and District levels, corresponds to Table B-III of 1961 with slight changes. It has been compiled into two parts. Part A deals with urban population classified into nine industrial categories of workers and a separate category of non-workers, cross-tabulated by literacy and various educational levels. Part B furnishes the same information for rural areas but the educational levels adopted are not as elaborate as those for the urban areas. This table indicates to some extent the employment of persons of different educational standards amongst the various industrial categories. The educational background of the available manpower can also be assessed to a great extent with the help of this table.

TABLE B-IV PART A

B-IV PART A—INDUSTRIAL CLASSIFICATION OF PERSONS AT WORK OTHER THAN AT CULTIVATION AS MAIN ACTIVITY BY SEX AND DIVISIONS, MAJOR GROUPS AND MINOR GROUPS

THIS TABLE, presents the distribution of population at work other than at cultivation by Divisions, Major Groups and Minor Groups of the National Industrial Classifications 1970, which has been adopted with suitable modifications wherever necessary. The data in this table is presented at State and District levels for "All Areas" and "Urban Areas" separately. This is a very important economic table as it gives a detailed picture of employment position in various sectors of economy.

It is supplemented with an appendix which provides information which was available in B-IV Part C of 1961 Census in so far as it relates to the Manufacturing, Processing, Servicing and Repairing workers. In this appendix, the workers are classified by Household Industry and Non-household Industry.

TABLE B-IV PART B

INDUSTRIAL CLASSIFICATION OF WORKERS IN MANUFACTURING, PROCESSING, SERVICING AND REPAIRS ON HOUSEHOLD INDUSTRY BASIS AS MAIN ACTIVITY BY SEX AND CLASS OF WORKERS

THIS TABLE. which presents the distribution of workers at Household Industry by Divisions, Major Groups and Minor Groups of the National Industrial Classifications 1970, further classified by class of workers, broadly corresponds to Table B-IV of 1961 Census. The data in this table is represented only at the State level for Total, Rural and Urban areas by sex.

The only difference between the two is that the present table provides data for two classes of workers, namely employees and single workers. Though the number of family workers is not presented it can be derived from the table itself.
