PAPER 1 OF 1979

REPORT OF THE EXPERT COMMITTEE ON POPULATION PROJECTIONS

P. PADMANABHA
OF THE INDIAN ADMINISTRATIVE SERVICE
Registrar General & Census Commissioner, India

DEMOGRAPHY DIVISION
OFFICE OF THE REGISTRAR GENERAL INDIA
MINISTRY OF HOME AFFAIRS
NEW DELHI-110011

PREFACE

On the eve of the formulation of the Third Plan, about 1958, it was recognised that population projections were essential in considering the relationship of population growth and economic development and as a consequence an Expert Committee was constituted by the Planning Commission to work out population projections for the use of official and other agencies. Since then, such an Expert Committee has been set up at various points of time to work out population projections. This report presents the results of the deliberations of the latest committee.

The constraints that operate in working out projections and the assumptions that have necessarily to be made are many. The committee has had to recognise these constraints and make certain assumptions and these have been spelt out in the preliminary explanatory chapters. The report incorporates the methodology and all the tables worked out by the Expert Committee.

The projections were worked out in the office of the Registrar General, India, on the basis of the recommendations and under the guidance of the Committee. The task was of an intensive and time-bound nature and considerable care and expertise were necessarily brought to bear in this task. I must place on record my thanks to the members of the Expert Committee for their ready response to a series of meetings and to their total involvement in this exercise. I must also express my particular thanks to all those of our colleagues who were drafted to this work and unhesitatingly gave of their best. They were ably guided by Shri K. S. Natarajan, Senior Research Officer to whom a large share of the credit for the completion of the work and its quality must go. I must in particular place on record my thanks to Shri S. S. Bawa, Investigator; Shri L. P. Gupta, Smt. R. K. Chaudhry, Statistical Assistants; Smt. M. Podikunju, Shri K. P. Gupta, Naresh Chand, Smt. Rani Arora, Computers; Smt. Saroj Chopra, Shri P. K. Juneja, Smt. Dipali Bose, Shri C. L. Sahni, Smt. Manju Bose, Asstt. Compilers; S/Shri S. S. Verma, Gr. III Stenographer and S. N. Sahu, Typist. If a personal note will be pardoned, I must tender my thanks to my predecessor Shri R. B. Chari, under whose chairmanship much of the work of the Expert Committee had been completed before I took over. This, I need hardly add, considerably eased my task.

CHAPTER I

Introduction

POPULATION PROJECTIONS FOR OFFICIAL USE WORKED OUT UNDER THE GUIDANCE OF AN EXPERT COMMITTEE

I.1 To have a reliable series of population projections for future use, the Planning Commission has been setting up expert committees since 1958. These expert committees comprise of knowledgeable people in the field of demography. The population projections are based on the latest available census data and the vital rates.

I.2 After 1971, there were two expert committees. The first committee was constituted after the release of 1971 census provisional population totals. The terms of reference of this expert committee were to revise the existing official series of projections in the light of the 1971 census provisional population totals and any further data available from time to time. The members of this expert committee were:—

1.	Shri A. Chandra Sekhar, Registrar General, India	Chairman
2.	Dr. N. T. Mathew, Director, C. S. O., New Delhi	Member
3.	Shri P.B. Gupta, I.S.I., Calcutta	Member
4.	Dr. K.C. Seal, Director (Plg.) Department of Family Planning	Member
5.	Dr. S. N. Agarwala, Director, I. I. P. S., Bombay	Member
6.	Dr. A. Vaidyanathan, Director, Perspective Planning	Member
7.	Shri S. Raghavachari, Assistant Registrar General	Convener

I.3 This expert committee revised the then existing series of projections (1964) by formulating fresh mortality and fertility assumptions in the case of India only. The projections for the states were revised by making use of ratio method. The role of this committee was restricted to revise the then existing series. In the absence of the detailed sex-age distribution the figures were termed provisional.

I.4 With the release of 1971 census final population totals and availability of firm data on vital rates, the Planning Commission felt the need for another series of projections based on more recent data. These projections were to replace the ones which at that point of time were essentially revision of the old series. The Committee was reconstituted in 1974. Some members of the expert committee constituted in 1974 having changed over to other assignments, the expert committee at present is as under:—

1.	Shri P. Padmanabha, Registrar General, India	Chairman
2.	Dr. K. C. Seal, Director, Central Statistical Organisation	Member
3.	Sh. S.S. Ahluwalia, Senior Research Officer, Planning Commission	Member
4.	Dr. J.R. Rele, Director, I. I. P. S., Bombay	Member
5.	Dr. M. V. S. Rao, Director (E), Deptt. of Family Planning	Member
6.	Dr. S. Biswas, Reader, College of Medical Sciences	Member
7.	Shri K. S. Natarajan, Senior Research Officer, Office of the Registrar General, India	Convener

I.5 Shri R.B. Chari who was the Registrar General India, 1974-1977, acted as chairman for a number of meetings. The terms of reference of this expert committee were very wide as compared to its immediate predecessor. This expert committee which met about 6 times made projections by component method not only for India, but also for fifteen major states by age & sex for quinquennial years as well as plan years 1971-91. Apart from this rural/urban projections at India as well state level are also made.

I 6 Chapter II presents the assumptions and the methodology used.

Note: - The notification reconstituting the Expert Committee is reproduced in the annexure to this chapter.

Annexure to Chapter I

No. M-12019/1-D/74-S&S

Government of India

Planning Commission

(Statistics and Surveys Division)

Sardar Patel Bhavan, Parliament Street,
New Delhi-1, the 20th May, 1974

OFFICE MEMORANDUM

In order to provide a set of Population Projections for use in the preparation of the Third Five Year Plan, an Expert Committee on Population Projections was first appointed in 1958, under the Chairmanship of the Registrar General, India. The Expert Committee has thereafter been reconstituted from time to time to revise the projections on the basis of latest available data. The Committee was last reconstituted in 1971.

2. With the release of provisional smoothed series of age and related life tables based on the 1% sample advance tabulation of 1971 Census, it has been decided to reconstitute the Expert Committee on Population Projections, as a Committee of the Planning Commission, to review the existing official series of population projections. The composition of the Expert Committee will be as under :—

1.	Registrar General, India	Chairman
2.	Director, Central Statistical Organisation	Member
3.	Director, International Institute of Population Studies, Bombay	Member
4.	Director (EV), Department of Family Planning	Member
5.	Representative of Perspective Planning Division, Planning Commission	Member
6.	Representative of Institute of Applied Manpower Research,	Member
7.	Director, Statistics and Surveys Division, Planning Commission	Member
8.	Shri K. S. Natarajan, Office of the Registrar General, India.	Convener

Other members may be coopted as and when deemed necessary.

3. The terms of reference of the Expert Committee will be to revise the existing official series of population projections in the light of 1971 Census provisional data of age and related life table and any further data that may be available from time to time.

4. The Expert Committee will submit its report to the Planning Commission as soon as possible.

5. The non-official members of the Committee will draw their T. A. & D. A. for attending the meetings of the Expert Committee and for this purpose they will be considered as belonging to Grade 1 of the Central Services. Further, they will draw daily allowance at the maximum rates admissible to Grade I officers. The expenditure involved will be debitable to :

Demand No. 72 A.

Major Head "19-General Administration."

A—Secretariate and Attached Offices.
A—1 Planning Commission.
A—i (1) Headquarters Establishment.
A—I (3)—Travelling Expenses.

2. Director, Central Statistical Organisation, Sardar Patel Bhavan, Parliament Street, New Delhi-1.
3. Director, International Institute of Population Studies, Chembur, Bombay-71.
4. Director (EV), Department of Family Planning, Government of India, Post Box 5410, New Delhi.
5. Director, Perspective Planning Division, Planning Commission, New Delhi.
6. Director General, Institute of Applied Manpower Research, Indraprastha Estate, Ring Road, New Delhi.
7. Director, Statistics and Surveys Division, Planning Commission, New Delhi.
8. Shri K. S. Natarajan, Office of the Registrar General, India, 2-A, Mansingh Road, New Delhi.
9. Joint Secretary, Plan Coordination Section, Planning Commission, New Delhi.
10. Chief (Coord.), Planning Commission, New Delhi.
11. Deputy Secretary (Coord.), Planning Commission, New Delhi.

CHAPTER II

POPULATION PROJECTIONS FOR ALL INDIA

II.1 Population projections have been worked out with the following assumptions regarding fertility and mortality.

II.1.1 *Fertility* : Population has been projected using three different fertility assumptions. Assumption I corresponds to the targets, fixed earlier, of reducing the birth rate to 25 by 1984. Beyond 1984 a decline of 1 point per year has been assumed.

II.1.2 Assumption II is based on a rough evaluation of the performance to target ratio observed prior to 1975 and an extrapolation of the trend to future years.

II.1.3 Assumption III is based on current thinking on family planning. It is felt that the birth rate may reach a level of 30 point by 1982-83, the last year of first five years of the rolling plan commencing from 1970. A further reduction beyond that level may be an onerous task, since it may involve a control of fertility among the hard core of the population. It was, therefore, assumed that the reduction of birth rate below the level of 30 may be a slow process. A reduction of 1 point every two years was assumed. The rates derived for various quinquennia were as follows :

Crude birth rate during various periods

	Derived birth rates for quinquennia			
	1971—75	1976—81	1981—86	1986—91
Assumption I	35.5	30.9	26.0	21.0
Assumption II	35.4	32.7	28.0	23.0
Assumption III	36.6	32.9	29.5	27.0

II.1.4 *Mortality* : Starting with the life table for 1961—70, the annual increase in the expectation of life at birth may be taken as 0.50 year for males and 0.55 year for females during the period under consideration. This will ensure that by 2001 the difference in e_o^o would vanish, giving an expectation of 64.0 for both sexes.

II.2 Projection III has been recommended for official use.

II.3 *Method of projection :* The all-India life tables for the decade 1961-70 based an 10% rural and 20% urban sample of slips (Paper 1 of 1977) were taken to be centred around 1966. Minor revision was made in the life table for males at the old ages as suggested by the working group meeting on mortality. After this revision, the mortality at old age for males was slightly higher than that of females. The expectation of life at birth did not change materially being 46.4 for males instead of 46.5 as originally shown. The following steps were involved in building up a projection of mortality rate for various quinquennial years.

II.3.1 *Mortality level corresponding to each sex :* Levels of age specific mortality rates for base year were read off from the west model life table given in Coale and Demeney regional model life tables.

II.3.2 It was assumed that the age specific mortality would conform to the west model pattern associated with the assumed e_o^o by 2001.

II.3.3 Mortality levels for each age for the intervening quinquennia were determined linearly.

II.3.4 The values of 5^qx's for the interpolated levels were then obtained. The value of expectation of life at birth was calculated from these 5^qx's. These were close to the assumed values of expectation of life at birth.

II.3.5 The survival ratios for each age were read off from the west model life tables corresponding to the associated mortality level.

II.3.6 The method adopted for deriving the population aged 0-4 from the assumed birth rate is given in appendix.

Rural-Urban Projections –India

II.4 The expert committee went into the method of projecting rural/urban population in considerable details. Two procedures were considered by the committee for the purpose. The alternates considered were :—

II.4.1 The projecting the trend in urban to total population, size-class-wise.

II 4.2 projecting the urban population by examiningthe urban-rural-growth-differential (URGD) experienced in the past.

Rural and urban proportions since 1901 and alternative measures of the tempo of urbanisation, India

Year	% of urban population to total	Growth rate		URGD
		Rural	Urban	
1	2	3	4	5
1901	10.84			
1911	10.29	0.62	0.03	−0.59
1921	11.18	−0.13	0.80	+0.93
1931	11.99	0.96	1.77	+0.81
1941	13.86	1.12	2.84	+1.72
1951	16.19	0.85	3.50	+2.65
1961	17.97	1.76	3.05	+1.29
1971	19.90	2.00	3.29	+1.29

II.5 As may be seen from the above table, presenting the figures of urban and rural proportions of India, the URGD have been constant during the last two decades, when the comparable definitions were used for the classification of towns. Alternate projections were made using constant URGD, increasing URGD and decreasing URGD. One view was that with increasing industrialisation the country may witness rapid urbanisation accentuating the rural urban growth differentials. As opposed to this was the view that the migration in the past to urban areas is not necessarily all due to economic pull of the urban areas and that this trend may be reversed if the rural development plans envisaged take effect. Differential impact of the increasing tempo of family planning measures on the natural growth rate was also considered.

II.6 It was felt that purely mathematical projections may not be relied upon in toto as the past growth trends may not hold good. The concensus was that the URGD method in which the percentage level of urbanisation rises in the manner of a logistic curve will be more suitable for such purposes. Considering the past levels of rural to urban migration reclassification of cities and the expected decline in natural growth rate, and the virtual constancy observed during last two decades it was decided to accept the urban projections with an URGD of 1.29.

Sex composition of the rural and urban population

II.7 The urban population was projected assuming an urban-rural-growth-differential (URGD) of 1.29. To obtain the sex composition of the rural and urban population, the size of the rural male population was first calculated. It was assumed that the trend in rural sex ratio would be similar to that of total population whose projection by sex is already available. The proportion $\frac{R_m}{R}$ (ratio of rural male population to the total rural population) was estimated for the years 1976, 81, 86 and 91 assuming the rate of change observed in the corresponding ratios for the total population. The formula used was as follows :-

$$\left[\frac{R_m}{R}\right]_{1971+5r} = \left[\frac{R_m}{R}\right]_{1971} \times \frac{\left[\frac{T_m}{T}\right]_{1971+5r}}{\left[\frac{T_m}{T}\right]_{1971}}$$

r = 1, 2, 3 and 4.

Where :

R = Rural population.

R_m = Rural male population.

T = Total population of all areas.

T_m = Male population of all areas.

II.8 The rural male population for the years 1976, 81, 86 and 91 was estimated by multiplying the above ratio by the corresponding projected rural population. Population of rural females, urban males urban females were then obtained by substraction.

Age distribution of rural and urban population :

II.9 Estimates of the rural and urban population of India were available by sex for the years 1971, 76, 81, 86 and 91. Age distribution of the projected population into broad age groups 0-14, 15-29, 30-44, 45-59 and 60+ was obtained by the method of "difference eliminations". The various steps involved were as follows. All the calculations were done separately for each sex.

II.10 *Base period data* : The age distribution of the rural and urban areas of India as reported in 1971 census was assembled in a 5 x 2 matrix form. The marginal totals were then adjusted to correspond to 1971 smoothed age data as on 1st March by repeated iterations.

II.11 Total population by broad age groups and rural urban break-up of the total population were available for the years 1976, 81, 86 and 91. Based on the 1971 rural/urban age distribution as obtained in II.10 above the age distribution for the subsequent quinquennial years were obtained by two way iterations (by method of difference elimination).

CHAPTER III

POPULATION PROJECTION FOR STATES AND UNION TERRITORIES FOR THE PERIOD 1976-91

III.1 The expert committee decided that projections by component method would be attempted only for the 15 states whose population as per 1971 census was above 10 millions. The assumptions for these states were as follows :

III.1.1 *Fertility assumptions*: The reduction of birth rate to 30/1000 by 1982-83 is considered feasible at the national level. Even this moderate target may require a lot of efforts on the part of various states. In particular certain states which show poor performance in family planning will have to improve. It is felt that states which had performed well may find it increasingly difficult to improve their performance beyond a point. It is recognised that any reduction in fertility can be brought about only by a constant review and by taking corrective action wherever deficit occurs and at the present stage, a lot of governmental efforts would be needed. An additional factor to be kept in mind is that a certain per cent of the allocation of the plan funds would be based on the performance in family planning.

III.1.2 The family planning efforts needed at the national level to achieve the reduced birth rate were distributed statewise taking into account factors such as the population size, the number of female literates, state domestic product, expenditure on family planning and performance gap. These resulted in an estimate of the proportion of couples who will be effectively protected if such an approach is followed. The general fertility rate has then been worked out upto 1983 assuming that it is directly proportional to the percentage of couples not protected. The general fertility rates so worked out for the mid points of the quinquennium were then extrapolated for the quinquennium 1986-91. Prorata adjustment was done to ensure that the general fertility rates so obtained for the state would be consistent with the general fertility rate worked out at the national level. This resulted in an increase in the general fertility rate extrapolated for 1986-91. It was therefore stipulated that in no case should the birth rate during 1986-91 be more than that for the earlier quinquenniums.

III.1.3 The percentage of couples expected to be effectively protected in various states is as follows :

Statewise percentage of couples effectively protected (1978.5 & 1983.5)

States	Percentage of couples effectively protected	
	1978.5	1983.5
1	2	3
1. Andhra Pradesh	27.71	38.83
2. Assam	22.19	31.33
3. Bihar	18.16	33.11
4. Gujarat	28.21	40.19
5. Haryana	28.97	31.15
6. Mysore (Karnataka)	24.06	40.33
7. Kerala	31.30	48.27
8. Madhya Pradesh	25.71	35.40
9. Maharashtra	35.47	43.91
10. Orissa	25.09	35.96
11. Punjab	26.00	40.52
12. Rajasthan	17.72	32.21
13. Tamil Nadu	30.24	44.60
14. Uttar Pradesh	17.36	35.19
15. West Bengal	28.13	43.83

III.2 Mortality Assumptions : Expectation of life at birth :

In accordance with the assumptions made for the expectation of life at birth for males and females, the value of the expectation of life at birth for the 1961-70 for states centred at 1966 were taken as base line data. States were grouped into four groups according to their level of expectation of life during

1961-70. Differential rates of future annual improvement in the expectation of life were assumed for the four groups as follows :-

III.2.1 Higher rates of increase have been assumed for those states which showed relatively low expectation of life at birth for 1961-70. In setting these assumptions, care was taken to ensure that (a) the weighted average of the improvement in e_0^o assumed for the states would be close to that assumed for all India; viz. 0.50 for males and 0.55 for females (b) the differences in e_0^o between the states were likely to be narrowed down in future and (c) the relative position of states would remain the same.

Annual increase in expectation of life at birth for males :

Group	*State*	*Male*
Group 1	Kerala	0.30
Group 2	Assam, Punjab, Rajasthan	0.45
Group 3	Orissa, West Bengal, Haryana, Gujarat, Maharashtra, Mysore (Karnataka), and Madhya Pradesh	0.50
Group 4	Andhra Pradesh, Tamil Nadu and Uttar Pradesh	0.55

III.2.2 In working the female expectation of life at birth for these states the following assumptions were made :—

(a) In the east and north zones where the male-female differentials in e_0^o were high improvement in e_0^o was assumed to be 0.1 year per annum higher than males.

(b) In states like Maharashtra and Gujarat where male and female differentials did not exist, improvement in e_0^o was assumed to be of the same order.

(c) In south and central zones where male-female differentials were low; female e_0^o were assumed to be higher than males by 0.05 years per annum.

Expectation of life at birth for various years is presented in table 16.

III.3 *Migration* : The effect of migration on state growth rate has been generally small. Any assumptions regarding migration can, therefore, only be approximate. The rates of migration estimated sex-wise from the 1961 and 1971 place of birth data and survival ratios from the 1961-70 life tables, were assumed to continue for the next two decades. The rates assumed have been indicated in table 17. Since the total number of migrants was small in all states, no separate adjustment was done for age distribution migration.

III.4 *Methodological details :* Values of the life table 5^qx for 1961-70 for a given value of e_0^o were obtained by adjusting the level of this function shown by zonal life table suitably. It was assumed that by 1991 the life table would be the same as the west model life table corresponding to the projected e_0^o. The 5^qx for the intervening years were then interpolated linearly. It was verified that the values so adjusted yielded the desired e_0^o by constructing abridged life tables for males and females for each state and quinquennium. The five year survival ratios were then derived from the abridged life tables so constructed. Population aged 0—4 were estimated by making use of the birth rates assumed.

Population projections for other states/union territories whose population was below 10 million in 1971.

III.5 The 15 major states for which projections were done by the component method constituted about 96.57% of the population of India as of 1971. The other states and union territories contributed only 3.43 percent. The growth rates of individual union territories were highly erratic and no clear trend in growth rate was discernable. Therefore, the population of these states and territories as a whole was first projected by method similar to that of the urban-rural-growth-differential method. The exponential growth rates of these states and union territories taken together and the 15 major states were worked out for the various decades. The difference in their growth rates observed for the decades 1951-61 and 1961-71 were assumed to remain constant during the year 1971-81 and 1981-91. This gave the growth

for these decades. Since the all India population projections were already available the proportion of population in these states and union territories were read off by using the table of logistic curve presented in annex (i) of manual on the Methods of Projection of Rural and Urban Population. (U.N. Manual No. VIII). The proportions estimated were as follows :—

Year	*Proportion to total population*
1976	3.5882
1981	3.7617
1986	3.9582
1991	4.1688

III.6 The population of these states and union territories were then estimated from the projected all India population.

III.7 Once the total population of these states and union territories were obtained those of the individual union territories were got by repeated application of similar mothed. Steps involved were as follows :-

(i) The union territories were arranged in descending order of population (Pi) as per 1971 census. The population was then cumulated from below, giving the sums of the union territories of size less than or equal to given union territory (Ti).

(ii) The change in the proportions Pi/Ti in 1961 and 1971 was assumed to remain constant for the future years and the proportion for future years estimated. Making use of these proportions and the projected total population of the 15 union territories, the population projected of the individual union territories were obtained one after another.

III.8 In the absence of the requisite data, the sex age distributions of the projected population were obtained by applying to the total population, the adjusted sex age proportion worked out on the basis of the smoothed distribution published in the 1971 census in combination with the percentage change in the proportion shown by the adjoining state. The union territories and corresponding adjoining states whose experience was drawn up for this purpose have been indicated in the following tables :

Union Territories and the corresponding adjoining States whose experience has been drawn upon for projection purpose.

Union Territory	*State*
1	2
1. Andaman & Nicobar Islands	West Bengal
2. Arunachal Pradesh	Assam
3. Chandigarh	Punjab
4. Dadra & Nagar Haveli	Maharashtra
5. Delhi	Punjab
6. Goa, Daman & Diu	Maharashtra
7. Himachal Pradesh	Punjab
8. Jammu & Kashmir	Punjab
9. Lakshadweep	Kerala
10. Manipur	Assam
11. Meghalaya	Assam
12. Nagaland	Assam
13. Pondicherry	Tamil Nadu
14. Sikkim	West Bengal
15. Tripura	West Bengal

III.9 The sexwise population so obtained were added to the population of the 15 major states (sexwise) and the sum prorata adjusted to tally with all India male and female population. No such adjustment was made to adjust the age in groupwise population, in view of the heavy work load involved.

III.10 The projected population have been presented in the table. In presentation of statewise figures, states have been arranged alphabatically according to the methodology used for projections. The projected figures for 15 states with a population of 10 million and above in 1971 and for which component method was used have been presented first, followed by the remaining states.

Single year age population

III.11 In the group 5-24 for the quinquennial years 1971, 76, 81, 86 & 91 and for the plan years 1974, 78, 83 & 88, were obtained by applying Sprague Multipliers to five years age group totals. In certain states and union territories, the five year population has not come out in descending order, as one would expect them. This may be attributed to

the migration patterns in these territories affecting the age distribution. It is, therefore, suggested that while using this data for such state and union territory, one should group them into the relevant age groups, wherever feasible.

Statewise population projections by rural and urban

12. To project the urban population statewise, the rural-urban-growth-differentials for the decades 1951-61 and 1961-71 were examined statewise. It was found that, these fluctuated very much unlike the all India trend. It was, therefore, decided to project the urban population statewise by projecting the proportion of urban population (U) to total population (T) observed during the earlier censuses. For this purpose the ratio U/T was calculated from 1931. A straight line was fitted to these ratios. Without exception straight line fit was found good. On the basis of fitted straight line, the proportions were estimated for the years 1971, 76, 81, 86 and 91. These estimated proportions for various years were then adjusted pro-rata by a factor obtained by dividing the 1971 census ratio by the 1971 estimated ratio. The adjnstments were only marginal in all the cases. Based on these adjusted ratios and the statewise projected population, the urban population was estimated statewise for various years.

13. In states and union territories like Manipur, Sikkim, Andaman and Nicobar Islands, Arunachal Pradesh, Chandigarh, Goa, Daman and Diu and Pondicherry, the figures beyond 1971 were obtained by simple extrapolation. For this purpose, the difference in urban proportion in the 1961 and 1971 censuses were added to 1971 census urban proportion to obtain 1981 proportion and so on.

14. Based on the ratios so obtained the population was worked out statewise. These were then added and tallied with all-Indla urban population already obtained. The differences were found to increase with years. These differences were prorata adjusted among various states so as to tally with the all-India figures already obtained and the proportion of urban re-worked.

15. The sex and age break up of the statewise urban and rural population were obtained in a manner identical to all India break up, the details of which have been explained elsewhere.

Table 1

Consolidated statement of projections from 1971 to 1991

Expectation of life at birth for base year 1966 (1951—70) : M—46.37, F—44.65

Base year G.F.R. : 193 Infant mortality rate : M—130, F—128

Annual increase in expectation of life (year/year) : M—0.50, F—0.55

Pondicherry	42.03	51.16	60.39	69.56	79.35

Appendix Table D

Notations used for projections of male and female population for the age-group '0-4' from assumed birth rate :

i) b = assumed birth rate for the quinquennium.

ii) S_b^M and S_b^F are the survival ratios from birth to 0-4 for males and females respectively for the quinquennium.

Further let $V_M = \frac{1}{S_b^M}$ and $V_F = \frac{1}{S_b^F}$

iii) Sex ratio at birth : 105 : 100

iv) $K_M = \frac{b \times 2.5 \times 105}{205}$ $K_F = \frac{b \times 2.5 \times 100}{205}$

v) O^P = total population relating to the initial year of quinquennium.

vi) ${}_1P_{5+}$ = total population age 5 and over for the terminal year of quinquennium.

vii) ${}_1P_{0-4}^M$ and ${}_1P_{0-4}^F$ are males and females age 0-4 for the the terminal year of quinquennium.

The Method

$$\left.\begin{array}{l}\text{Number of female}\\ \text{births during}\\ \text{quinquennium}\end{array}\right) \frac{{}_1P_{0-4}^F}{S_b^F} = b \times \frac{100}{205} \times 2.5 \left[{}_0P + {}_1P_{5+} + {}_1P_{0-4}^M + {}_1P_{0-4}^F \right]$$

$$= K_F \left[{}_1P_{5+} + {}_0P \right] + K_F \left[{}_1P_{0-4}^M + {}_1P_{0-4}^F \right]$$

$$\text{or} \quad \left[V_F - K_F \right] \times {}_1P_{0-4}^F - K_F \times {}_1P_{0-4}^M = K_F \left[{}_0P + {}_1P_{5+} \right]$$

Similarly $$\left[V_M - K_M \right] \times {}_1P_{0-4}^M - K_M \times {}_1P_{0-4}^F = K_M \left[{}_0P + {}_1P_{5+} \right]$$

From the two equations, ${}_1P_{0-4}^F$ and ${}_1P_{0-4}^M$ were solved.
