A NOTE ON THE SAMPLING PROCEDURE ADOPTED IN THE 1971 CENSUS FOR SOCIAL AND CULTURAL TABLES (EXCEPT C-I & C-V)

Sample size : A ten per cent sample of the slips was selected linear systematically with a random start from the individual slips relating to the rural parts of a tehsil/anchal/police station. In the urban part of the district, a twenty per cent systematic sample of the individual slips was selected with a separate random start. The sample sizes were adopted on consideration of required precision, available resources and operational convenience.

Selection procedure : The sample design adopted in the 1971 census was a stratified systematic sample of individual slips For the purpose of sample selection, each district was divided into three sub-regions (1) Tehsil/anchal/police station (rural); (2) Non-city urban district and (3) City (urban unit with 100,000 and more population).

These sub-regions were termed as operational units. If, however, any of the operational unit was unduly large, it was split into sub-operational units of atleast 20,000 persons. Similarly, small-sized operational units were either clubbed together or tagged on to a contiguous larger unit so as to form an "effective operational unit" of the required minimum size. Adoption of these operational units ensured accuracy in sample selection, maintaining at the same time stability in the sampling fraction within the sampled areas. This procedure has ensured effective control over sample selection within each block, as also in the entire operational unit.

For the purpose of the Primary Census Abstract (PCA) the individual slips were sorted into ten broad industrial categories and nine broad age groups for each of the sexes. The ten industrial categories of workers and non-workers were as follows : (I) Cultivators ; (II) Agricultural labourers ; (III) Livestock, forestry, fishing, hunting and plantations, orchards & allied activities (IV) Mining & quarrying ; (Va) Manufacturing, processing, servicing & repairs in *household industry*; (Vb) Manufacturing, processing, servicing & repairs in *other than household industry*; (VI) Construction; (VII) Trade & commerce; (VIII) Transport, storage & communications; (IX) Other services and (X) Non-workers.

The nine age groups into which the slips belonging to each industrial category were sorted, were 0-14, 15-19, 20-24, 25-29, 30-39, 40-49, 50-59, 60+ and 'age not stated'. Thus the individual slips of a particular operational unit were sorted into $11 \times 9 = 99$ cells, separately for males and females. Sampling was done in each of the operational units independently by taking separate random starts The slips were then distributed into 10 (or 5) pigeon-holes for rural/urban samples and one pigeon-hole was selected at random. The slips falling in the selected pigeon-hole constituted the sample. For operational details of the sampling procedure and instructions, the 'Manual of instructions on sorting, compilation (manual processing) & sampling procedures' may be consulted. All tables except A-1 to A-V (Pop tables), B-I Part A and B-II (economic tables), C-V (mother tongue), C-VII (Religion) and C-VIII (scheduled castes & tribes) have been prepared on a sample basis.

Estimation procedure : The tables prepared for each of the districts/states from the ten per cent rural and twenty per cent urban sample slips have been inflated to give the final estimated tables Estimates have been obtained by making use of the cell frequencies (usually labelled as 'controls') available from the tables prepared on full count basis, namely, PCA and B-I Part A. In order to ensure the maximum possible inter-table consistency, it became necessary to use the estimated frequencies of a few of the final tables as controls for estimating some cell frequencies of other tables.

This way of estimating the cell frequencies ensured that marginal totals of estimated tables tallied with that of the full-count tables. This is convenient to the user because, after adjustment, the identical marginal totals are found in tables having the same marginal specification. "The adjustment diminishes the sampling variance to some extent, the more the controls, the smaller the sampling variance of the adjusted frequencies"[1]. Further, adjustment to

1. Deming, W.E. Statistical adjustment of data Ch. VII.

known control totals has at the same time the effect of eliminating biases in the nature of inherent differences between the sample and complete count.

For the purpose of estimation of final tables, a set of multipliers was prepared for each table. A multiplier is the ratio of full-count frequency of some characteristics from PCA or Table B-I part A and the corresponding sample frequency of the same characteristics from the sample table. The following statement gives the level of presentation of the tables and the related controls on which the multipliers are based. The details will be presented in the report on sampling procedures to be published later :—

Table	*Level of presentation*	*Control based from tables*
C-II	District	B-I Pt. A & PCA
C-III Part A	—do—	,, ,,
C-III Part B	—do—	,, ,,
C-IV	State	,, ,,
C-IV App.	District	,, ,,

As no such control was readily available for C-VI (bilingualism), these were estimated by multiplying the sample values by 10 and 5 in rural and urban areas respectively.

Reliability of estimates : No exact formula can be given for the precision of the estimates in view of the systematic sampling design adopted. The relative standard error can be estimated roughly on the basis of simple random sampling, as $\sqrt{(1-f)\frac{1-p}{np}}$, where 'f' is the proportion samples, (0.10 in case of rural areas & 0.20 in case of urban areas) ; 'p' is the estimated proportion in any cell and 'n' the sample size being equal to ten per cent of individual slips in rural areas and twenty per cent in urban areas. In the present census, slips were sorted by sex, industrial category and age-group before sampling. It is expected that the efficiency must be considerably higher than a simple random sample of identical size. Extensive studies conducted have indicated that systematic sampling of individuals is more efficient than random sampling especially when the slips were pre-sorted for most of the socio-economic characteristics covered in a census[2]. Thus the estimates prepared on the basis of the systematic sampling in the present census can be expected to be quite reliable.

A NOTE ON THE SAMPLING PROCEDURE ADOPTED IN 1971 CENSUS FOR C-I PART A, C-I PART B (i) AND C-I PART B (ii)

Sample size : For the preparation of tables C-I Part A, C-I Part B (i) and C-1 Part B (ii) on household composition, a sample of residential households was drawn in two stages. In the first stage, a twenty per cent systematic sample of effective enumeration blocks (defined later) was selected systematically. In the second stage, a twenty per cent sample of population records relating to residential households was selected from each of the sample block, again systematically.

Selection procedure : For the purpose of sample selection, the rural and urban parts of each district were treated as separate strata. Within each stratum, a list of blocks was prepared by merging those containing less than 50 households with the neighbouring blocks. Blocks formed in this way were called 'effective enumeration blocks' or simply 'effective blocks'. This list of effective blocks so formed served as a frame for the selection of the first stage unit. A twenty per cent sample of effective blocks was then selected systematically. Having identified the first stage units, the population record books for the selected effective blocks were assembled. Within each selected effective block, the population records relating to residential households were serially numbered. To do this effectively, instructions were issued to fold the population record relating to 'houseless households or institutional households'. Care was also taken to see that only one serial number was assigned to a population record, whenever the record relating to a household covered more than one page. In cases where 'effective blocks' were formed by merging two or more blocks, the population record books corresponding to all the census enumeration blocks constituting the effective block, were assembled together and then the households were selected. Fresh random numbers were selected for each effective block. The population records corresponding to the selected households were marked 'S' at the right hand top corner with a stamp provided.

Estimation procedure : The tables prepared for each of the stratum were multiplied uniformally by 25 to give the final estimated table.

TABLE C-I Part A

Members of Households by Relationship to Head of Household Classified by Age-Groups

TABLE C-I PART A
MEMBERS OF HOUSEHOLDS BY RELATIONSHIP TO HEAD OF HOUSEHOLD CLASSIFIED BY AGE-GROUPS

This table has been prepared on 4% sample. It presents the data at State, Division and District level separately for total, rural and urban population. It gives the composition of the households by relationship to the head of the household classified by three broad age-groups *viz.* "All ages", "Less than 30", "30—49" and "50+". The figures for "Age not stated" are included in "All ages". The figures for the related and unrelated members of the households and the single member households have been shown separately. Relations have again been divided into two groups i.e., "Married relations" and "Never married, widowed and divorced or separated relations". Under "Married relations" the figures for specific relation as son, brother, father, mother, other males and other females have been shown separately. Again under "Never married, widowed and divorced or separated relations" the figures for specific relation as son, brother, daughter, sister, father, mother, other males and other females have also been shown separately. Among the "married relations", the spouses of the heads of the households have also been shown separately.

This table will be of interest to sociologists as it indicates the extent of the joint family system prevalent in the country. The age distribution of the heads of the households and their relations classified by marital status will further indicate the future trend of the joint family system. In 1961 Census its corresponding Table C-I was prepared on 20% sample for total, rural and urban population separately and figures were presented at the State, Division and District level. The relationship to the head was shown as "married sons" and "Other marital status relations", but were not classified by broad age-groups.

TABLE C-I Part B (i) and (ii)

Distribution of Households where the Head is a Male / Female by Relationship of Members with the Head

TABLE C-I PART B (i) AND B (ii)
DISTRIBUTION OF HOUSEHOLDS WHERE THE HEAD IS A MALE/FEMALE BY RELATIONSHIP OF MEMBERS WITH THE HEAD

This table has been prepared on 4% sample for total population and presented at the State, Division and District level. This table is presented in two parts, i.e., Part B(i) where the head is a male and Part B(ii) where the head is a female. The relations of the heads have been grouped into two, i.e., the "married relations" and the other marital status relations. Number of unrelated members have been shown separately. The relations of the head are more detailed under each of the two marital status groups.

This table also corresponds largely to Table C-I of 1961 Census. It will be of much interest to sociologists as it reveals composition of households having married relations also. It will also help in studying the differentials between the households having male and female heads respectively.

TABLE C-II

Age and Marital Status

TABLE C-II—AGE AND MARITAL STATUS

This table is prepared on 10% rural and 20% urban sample and the figures have been presented for total, rural and urabn populations at the State, Division and District level. This table shows the distribution of marital status sexwise & cross classified by age-group of 0-9, 10-14, 15-19, 20-24, 25-29, 30-34, 35-39, 40-44, 45-49, 50-54, 55-59, 60-64, 65-69, 70 + and "Age not stated". All persons in the age-group 0-9 have been shown as "Never married" irrespective of the actual entries recorded in the slips regarding marital status. This was with the idea that persons in this age-group, even if married, did not enter the fertility filed of the country and should be treated as unmarried.

This table corresponds to Table C-II of 1961 Census. It is an inportant demographic table indicates the trends of variations in the propoprtions of the various marital status conditions in different age-groups.

A person has been treated as "Never married" if he or she has never been married at any time before. A person who has ever been married and the marriage is subsisting at the time of enumeration with the spouose living is recorded as "married". Persons who are recognised by custom or society as married and those who are in stable *de facto* union are also shown as married. Even if a marriage is disputed in the locality, the person has been recorded as married if he or she says that he or she is married or in stable *de facto* union. A person whose husband or wife is dead and who has not been married again is recorded as "widowed". A person who has been separated from wife or husband and is living part with no apparent intention of living together again or who has been divorced either by a decree of a court or by an accepted social or religi-ons, custom but who has not been remarried is recorded as "Divorced or Separated".

TABLE C-III

Age, Sex and Education

TABLE C-III-AGE, SEX AND EDUCATION

This table has been prepared in two parts. i.e. table C-III part A for "Total" i e. rural or urban combined and C-III part B for Urban Areas only. These tables have been prepared on the basis of 10% sample (Rural) and 20% sample (Urban) and presented at the levels of state, Division and District. Both these parts show the distribution of population in thequinquennial age-groups o-4 . 30-34, 35+ and Age not-stated cross classified by literacy and educational levels. The levels of education are different for total and rural areas. The levels of education for table C-III part A are :- Literate (without educational level) primary, Middle, Matriculation or Higher Secondary, Non-technical diploma or certificate not equal to degree Technical diploma or certificate not equal to degree and Graduate and above. The same educational levels have been adopted for Table C-III part B upto the under-graduate level. The graduates and above have been further subdivided in C-III-part B into the following :

1. Graduate degree other than technical degree.
2. Post Graduate degree other than technical degree.
3. Technical degree or diploma equal to degree or post-graduate degree :
   (a) Engineering and Technology,
   (b) Medicine,
   (c) Agriculture, Veterinary and Dairying,
   (d) Teaching,
   (e) Others.

Literates (without educational level) include figures for educational levels which are not classifiable.

This table corresponds to table C-III of 1961 census. In 1961, this table was prepared in three parts i.e. table C-III part A-Age, Sex and Education in all Areas, part B-Age, Sex and Education in Urban Areas only and part C-Age, sex and education in Rural Areas only.This table will help measure the growth of literacy in the total population and in different age-groups as will since last census. It will appeard from the table that all persons in the age-group O-4 have been treated as illiterate.

Definition of literate followed in 1971 census is as follows :—

An illiterate person is one who can neither read nor write or can merely read but cannot write in any language.

Ability merely to sign one's name does not qualify a person to be treated as literate. He or she must have been able to write and to read with understanding for being considered as literate all children of age 4 years or less are treated as illiterate even if some of them are going to school and may have picked up reading and writing a few odd words.

A literate person is one who can both read and write with under standing in any language. It is not necessary that a person who is literate should have received any formal education or should have attained any minimum educational standard. The test for reading is ability to read any simple letter in print or in manuscript. The test for writing is ability to write a simple letter.

Table C-V

Single Year Age Returns

TABLE C-IV SINGLE YEAR AGE RETURNS

This table has been prepared on the basis of 10% (Rural) and 20% (Urban) sample and presen--ted for Total, Rural and Urban population with sex break-up at the State level only. It corresponds to table C-IV in 1961 Census which was presented at the State, Division and District levels. This table presents figures for each individual year of age begining from '0' that is, the age below one year. Age of each person was recorded in completed years as on last birth day.

This table is of immense interest to the demographers and actuaries as it affords the basic data for computation of mortality rates and preparation of the life table. Age is one of the most important items of demographic data and so extreme care was taken in recording the age of every individual. inaccuracies occur due to mis-statements by the respondents.

Table C-V

Mother Tongue

TABLE C-V MOTHER-TONGUES OF THE 1971 CENSUS

Part A : Distribution of languages (inclusive of mother-tongues grouped under each) specified in Schedule VIII to the Constitution of India.

Part B : Speakers of languages/mother-tongues (inclusive of mother-tongues where grouped) other than those specified in Schedule VIII to the Constitution of India.

These tables correspond to the all-India language tables of the census of India 1951 published in Census of India Paper I of 1954 and the language tables C-V of the Census of India 1961 published in volume I Part II-C (ii) – Language Tables and volume XVI – West Bengal and Sikkim Part II-C (i) Social and Cultural Tables.

The question on mother-tongues at the 1971 census and instructions to enumerators were as follows :

Question 14 : Mother-tongue

Definition : Mother-tongue is the language spoken in childhood by the person's mother to the person. If the mother died in infancy, the language mainly spoken in the person's home in childhood will be the mother-tongue. In the case of infants and deaf mutes the language usually spoken by the mother shall be recorded.

Record mother-tongue in full whatever be the name of the language as returned and avoid use of abbreviations. You are not expected to determine if the language returned by a person is the dialect of another major language and so on. You should not try to establish any relationship between religion and mother-tongue. You are bound to record the language as returned by the person as his mother-tongue and you should not enter into any argument with him and try to record anything other than what is returned. If you have reason to suspect that in any area due to any organised movement, mother-tongue was not being truthfully returned, you should record the mother-tongue as actually returned by the respondent and make a report to your superior Census Officers for verification. You are not authorised to make any correction on your own.

Table C-V Part A is in two sections : (i) showing the distribution of speakers of languages (inclusive of mother-tongues grouped under each) specified in Schedule VIII to the Constitution of India for the state and its sixteen districts separately for total rural and urban area cross-classified by sex and (ii) showing the distribution of speakers of these languages for sixteen districts, two hundred and ninety six tahsils and two hundred and twenty three towns in the state for total areas only cross-classified by sex. The data for the rural areas of the tahsil are not presented but they can be derived by subtracting data in respect of towns within the tahsil from the total tahsil figures.

Table C-V Part B presents speakers of languages/mother-tongues (inclusive of mother-tongues where grouped) other than those shown under Part A for the state, districts, tahsils and towns. This table is also being presented in two sections, (i) showing the speakers of these languages/mother-tongues for the state and its districts for total, rural and urban areas cross-classified by sex and (ii) showing the distribution of those languages/mother tongues for total areas of districts, tahsils and towns cross-classified by sex.

In both parts A and B, mother-tongues have been grouped in some cases under the relevant language (s). This has been done on the basis of information readily available or in the light of studies already made. Those 'identifiable' mother-tongues which returned 10,000 or more speakers each at the all-India level have been grouped in parts A and B as shown below.

Part A

BENGALI	—	Chakma; Haijong/Hajong; Malpaharia; Rajbangsi
HINDI	—	Bhojpuri; Garhwali; Hindustani; Kangri; Khortha/Khotta; Kumani; Kurmali Thar; Madhesi; Magadhi/Magahi; Maithili; Marwari; Nagpuria; Rajasthani; Sadan/Sadri
MARATHI	—	Kamari
SINDHI	—	Kachchhi

Part B

LAHNDA	—	Multani
*MUNDA	—	Kol
SANTALI	—	Karmali; Mahili

All other mother-tongues falling under Part B and which returned less than 10,000 speakers each at the all-India level or were not 'identifiable' on the basis of information available as of date are included in the category 'Others' occurring at the last entry in Part B.

BHOTIA/MUNDA/NAGA is a combination of various speeches spoken over long stretches of areas where the speakers preferred to give a general name. The languages appearing in Table C-V Part (B) are marked with asterisks.

Table C-VI

Bilingualism

C-VI BILINGUALISM

This table corresponds to table D-I Part II of the 1951 and C-VI of the 1961 censuses.

The question on bilingualsim at the 1971 census was :

Question 15 : Other languages

"After recording the mother-tongues in question 14, enquire whether the person knows any other language (s), Indian or foreign, and record language (s) returned by him against this question. In case he does not know any language apart from his mother-tongue, put 'X' against this question.

The number of languages recorded uuder this question need not be more than two. These languages should be other than his mother-tongue and they should be recorded in the order in which he speaks and understands best and can use with understanding in communicating with others. He need not necessarily be able to read and write these languages. It is enough if he has a working knowledge of these subsidiary languages to enable him to coverse in that language with understanding.

In this table, data on bilingualism are presented only for selected languages/mother-tongues (L-MTs). The selection of these L/MTs has been done on the basis of all India table C-VI Bilingualism of 1961 and a list of L/MTs was devised for all India. This list formed the basis for preparing the table on bilingualism as estimated from the processing of 10% rural and 20% urban sample slips. The rural table was processed manually and the urban table on the computer. The estimated tables for rural and urban areas as pooled are presented here.

Columns 2, 3 and 4 of the table give the total number of speakers of L/MT inclusive of MTs grouped under it. Columns 5, 6 and 7 give figures of such of the speakers who returned a second language, that is to say, any other L/MT not accounted for in columns 2, 3 and 4. Column 8 contains in 'run on' fashion the names of subsidiary L/MTs inclusive of L/MTs wherever grouped by number of male and female speakers within brackets.

Table F–Fertility Tables

All tables in this series have been prepared on the basis of 10% (Rural) and 20% (Urban) samples and presented at State level only.

Two questions were put to all married women (*i e.* all women whose marital status was "Married") at the Census to collect in formation on fertility. These were:
(i) What was the age of the married woman at marriage ? and (ii) Did she give birth (live birth) to a child during the last one year prior to the date of enumeration? Data have been compiled and tabulated from the answers recorded against the two questions in the enumeration slips.

A NOTE ON THE SAMPLING PROCEDURE ADOPTED IN THE 1971 CENSUS FOR FERTILITY TABLES

Sample size : A ten percent sample of the slips was selected linear systematically with a random start from the individual slips relating to the rural parts of a tehsil/anchal/police station. In the urban part of the district, a twenty percent systematic sample of the individual slips was selected with a separate random start. The sample sizes were adopted on consideration of required precision, available resources and operational convenience

Selection procedure : The sample design adopted in the 1971 census was a stratified systematic sample of individual slips for the purpose of sample selection, each district was divided into three sub-regions: (1) Tehsil/anchal/police station (rural); (2) Non-city urban district and (3) City (urban unit with 100,000 and more population).

These sub-regions were termed as operational units. If, however, any of the operational unit was unduly large, it was split into sub-operational units of at least 20,000 persons. Similarly, small-sized operational units were either clubbed together or tagged on to a contiguous larger unit so as to from an "effective operational unit" of the required minimum size. Adoption of these operational units ensured accuracy in sample selection, maintaining at the same time stability in the sampling fraction within the sampled areas. This procedure has ensured effective control over sample selection within each block, as also in the entire operational unit.

For the purpose of the Primary census abstract (PCA) the individual slips were sorted into ten broad industrial categories and nine broad age-groups for each of the sexes. The ten industrial categories of workers and non-workers were as follows: (I) Cultivators; (II) Agricultural labourers; (III) Livestock, forestry, fishing, hunting and plantations, orchards & allied activities (IV) Mining & quarrying; (Va) Manufacturing, processing, servicing & repairs in *household industry*; (Vb) Manufacturing, processing, servicing & repairs in *other than household industry*; (VI) Construction; (VII) Trade & commerce; (VIII) Transport, storage & communications (IX) Other services and (X) Non-workers.

The nine age-groups into which the slips belonging to each industrial category were sorted were 0-14, 15-19, 20-24, 25-29, 30-39, 40-49 50-59, 60+and 'age not stated'. Thus the individual slips of a particular operational unit were sorted into 11 x 9=99 calls, separately for males and females. Sampling was done in each of the operational units independently by taking separate random starts. The slips were then distributed into 10 (or 5) pigeon-holes for rural/urban samples and one pigeon-hole was selected as random. The slips falling in the selected pigeon-hole constituted the sample. For operational details of the sampling procedure and instructions, the 'Manual of instructions on sorting, compilation (manual processing) & sampling procedures' may be consulted.

Estimation procedure: All the tables F-I to F-V are presented at state level. The sample table F-I to F-V have been multipled by '10' in case of rural area and by '5' in case of urban area to estimate the final tables.

Reliability of estimates: No exact formula can be given for the precision of the estimates in view of the systematic sampling design adopted. The relative standard error can be estimated roughly on the basis of simple random sampling, as $\sqrt{(1-f)\frac{1-p}{np}}$, where 'f' is the proportion samples, (0.10 in case of rural areas & 0·20 in case of urban areas); (8 'p' is the estimated proportion in any cell and 'n' the sample size being equal to ten percent of individual slips in rural areas and twenty percent in urban areas. In the present census, slips were sorted by sex, industrial category and age-group before sampling. It is expected that the efficiency must be considerably higher than a simple random sample of indentical size. Extensive studies conducted have indicated that systematic sampling of individuals is more efficient than random sampling especially when the slips were pre-sorted for most of the sicio-economic characteristics covered in a census. Thus the estimates prepared on the basis of the systematic sampling in the present census can be expected to be quite reliable.

Table F-I

Distribution of currently married Women and the related births during the last year by religion, present age and age at marriage

TABLE F-I

DISTRIBUTION OF CURRENTLY MARRIED AND THE RELATED BIRTHS DURIND THE LAST YEAR BY RELIGION, PRESENT AGE AND AGE AT MARRIAGE

This table has been prepared in two parts. Part A relates to rural areas and part B to urban areas. It shows the distribution of currently married women and the related births during the last one year by religion, present age and age at marriage of the woman. Present age has been classified into Less than 13, 13-17, 18-22, 23-27, 28-32, 33-37, 38-42, 43-47, 48+and unspecified. Age at marriage has been classified into Less than 13, 13-17, 18-22, 23-27, 28+and unspecified. Religions have been arranged in alphabetical order.

This table will help in deriving differentials by religion in median age at marriage and in age specific fertility rates, total fertility and general fertility rate for various age-at-marriage groups.

An appendix has also been prepared for this table showing similar information for Sheduled Castes and Scheduled Tribes separately and presented at the state level only.

Table F-II

Distribution of currently married Women and the related births during the last year by Education, present age and age at marriage

TABLE F-II

DISTRIBUTION OF CURRENTLY MARRIADE WOMEN AND THE RELATED BIRTHS DURING THE LAST YEAR BY EDUCATION, PRESENT AGE AND AGE AT MARRIAGE

This table has been prepared in two parts : Part A for rural areas and Part B urban areas. It shows the distribution of women and related births by education, present age and age at marriage. The present age and age at marriage of the women have been classified into the same groups as in table F-I. Educational levels of the married women have been classified as Illiterate, Literate but less than Matriculate (includes educations not classified elsewhere), Matriculate or above but less than graduate, and Graduate and above.

This table will help in deriving differentials by education in median age at marriage and in age specific fertility rate, total fertility rate and general fertility rate for various age at marriage groups.

Table F-III

Distribution of currently married Women and the related births during the last year by religion, duration of marriage and age at marriage

TABLE F-III

DISTRIBUTION OF CURRENTLY MARRIED WOMEN AND THE RELATED BIRTHS DURING THE LAST YEAR BY RELIGION, DURATION OF MARRIAGE AND AGE AT MARRIAGE

This table has also been prepared in two parts : Part A for rural areas and Part B for urban areas. It shows the distribution of women and related births by religion, duration of marriage and age at marriage of the women. The age-groups of age at marriage are the same as shown in table F-I. Duration of marriage has been grouped as less than 1, 1-4, 5-9, 10-14, 15-19, 20-24, 25-29, 30+ and unspecified. Religions have been arranged in alphabetical order.

This table will help in deriving differentials by religion in duration specific fertility rates for various age-at-marriage groups.

An appendix has also been prepared for the table showing the similar information separately for Scheduled Castes and Scheduled Tribes and presented at the State Level only.

Table F-IV

Distribution of currently married Women and the related births during the last year by education, duration of marriage and age at marriage

TABLE F-IV

DISTRIBUTION OF CURRENTLY MARRIED WOMEN AND THE RELATED BIRTHS DURING THE LAST YEAR BY EDUCATION, DURATION OF MARRIAGE AND AGE AT MARRIAGE

This table has been prepared in two parts. Part A relates to rural areas and Part B to urban areas. It shows the distribution of women and births by education, duration of marriage and age at marriage. Education groups and groups of age-at-marriage are similar to those shown the table F-II while the groups of duration of marriage are the same as shown in Table F-III.

This table will help in deriving differentials by education in duration specific fertility rates for various age-at-marriage groups.

Table F-V

Distribution of currently married Women and the related births during the last year by Education Groups, present age and age at marriage

TABLE F-V

DISTRIBUTION OF CURRENTLY MARRIED WOMEN AND THE RELATED BIRTHS DURING THE LAST YEAR BY RELIGION, EDUCATION GROUPS, PRESENT AGE AND AGE AT MARRIAGE

This table has been prepared for rural and urban areas separately. It shows the distribution of women and births by religion-cum-education, present age and age at marriage of the woman—Groups of education, present age and age at marriage are similar to those shown in other relevant F-series tables in this volume.

The table helps in deriving differentials by religion-cum-education in median age at marriage and in age specific fertility rates, total fertility rate and general fertility rate for various age-at-marriage groups.
