ECONOMIC SURVEY, 1941

TRAVANCORE

PART I—REPORT

PART II—TABLES

BY

A. NARAYANAN TAMPI, B. A. (Oxon), Barrister-at-Law,

Census Commissioner, Travancore.

TRIVANDRUM :
PRINTED BY THE SUPERINTENDENT, GOVERNMENT PRESS,
1942.

PREFACE

The present Report embodies the results of a Survey which has the uniqueness of being the first ever conducted in the State on the Stratified Representative Sampling basis in preference to the more complicated and expensive but not necessarily more reliable Census method. The novelty of the procedure adopted naturally called for expert advice and technical direction at every stage of the investigation. I was fortunate in being able to secure this in ample measure in the course of my arduous task. I must acknowledge my indebtedness to the Government of His Highness the Maharaja for the numerous facilities afforded to me towards the successful discharge of my duties.

I am deeply grateful to Dewan Sachivottama Dr. Sir C. P. Ramaswami Aiyar for the invaluable help he was kind enough to extend to me from time to time by way of suggestion and advice, which his keen insight into economic problems, vast knowledge and varied experience rendered really inestimable. It was very kind of him to go through my draft Report and make helpful suggestions before it took final shape.

Dr. U. Sivaraman Nair of the Mathematics Department of the Travancore University brought to bear upon his role as my Statistical Adviser his special mathematical abilities, technical skill and expert knowledge of Sampling, to which the Survey owes not a little the accuracy of the returns, the tabulation of the figures, the extraction of the Tables and the correlation of the results so obtained for correct interpretation. I am sincerely thankful to him for his valuable assistance.

Mr. S. Varadarajan Nair, the Clerk in special charge of the office work pertaining to the Survey and the compilation and printing of the Tables, discharged his duties ably and well and I have great pleasure to place on record my appreciation of his services.

I also take this occasion to thank the various officers of the Co-operative Department who superintended and the Investigators who conducted the field work in the selected centres and the Superintendent and staff of the Government Press for the promptness and neatness with which all printing work connected with the Survey was executed.

Trivandrum,
25th February, 1943.

A. NARAYANAN TAMPI,
Census Commissioner.

ECONOMIC SURVEY

1941

INTRODUCTION

The need for conducting an Economic Survey of the State had been engaging the attention of the Government of Travancore even as early as 1905. In 1917 a general Industrial Survey of the State was conducted and a Report published. In 1925 the question came up in the shape of a motion in the Legislative Council. Though the same was lost by a narrow majority, Government expressed their sympathy with the object underlying it but decided to drop the question for the time being on account of its prohibitive cost. In 1931 an Economic Enquiry was conducted along with the Census. It was not then proposed to undertake an intense economic survey like the village surveys conducted in Bombay, Madras and the Punjab. The Census Commissioner of 1931 considered the direct method of ascertaining wealth and income to be undoubtedly the most satisfactory method of enquiry into the economic condition of the people, provided the persons questioned could be relied upon to furnish correct information. A special schedule was prepared by him for this enquiry and particulars of each "Earner" were recorded therein by the Enumerators at the preliminary counting of the population. He has, however, remarked that the qualitative study of the question was entirely left out of consideration for want of sufficiently accurate details and even in the quantitative aspect considerable limitation had to be imposed as the accuracy of figures could not be vouched for. Again the individual earner and not the family had been taken as the economic unit and information had not been recorded as to the number of dependants on each earner. He also has stated that the data collected were not sufficient for a detailed examination of the economic condition by age, sex or caste and therefore the problem of the distribution of wealth could only be dealt with in a general way. He further added that in view of the many possible sources of error described above it was considered inadvisable to convey a false impression of accuracy by the publication of lengthy tables giving figures to the last digit.

The need for the present Survey.

2. The question of conducting an Economic Survey had assumed serious proportions in the decade between 1931 and 1941. The Economic Development Board took it up but confined its attention, however, to the collection of statistics regarding a variety of topics like production, exports, imports, etc., which might be useful to the industrialist or the agriculturist. A scheme for the above was submitted to Government but had to be given up on account of its prohibitive cost. Government therefore suggested that much of the data could be collected and complied along with the population census work. Such a scheme was forwarded to the Census Commissioner in January 1940, to which he sent a reply suggesting that the Economic Survey could be conducted on a census basis with the help of the non-official Co-operators of the State. Government approved of the same and an elaborate schedule for the conduct of the Economic Survey along

The original Scheme.

with the population census was sent to the Press and the Co-operative Inspectors of the State were appointed as Assistant Charge Superintendents to be in immediate charge of the necessary operations. The idea at the time was to conduct a house to house survey on a census basis. It was estimated that 1,000 Investigators would have to work for a period of four months to complete the Survey.

Reasons for its abandonment.

3. As soon as I took charge I began to receive letters from the Co-operative Inspectors stating that in spite of their persuasion they could find little response from the non-officials for this work. I was at first inclined to doubt the veracity of their statements and therefore decided to study the situation at first hand by an extensive tour throughout the State. In the course of my checking the house-listing and house-numbering operations, I had opportunities to meet these Inspectors individually and testing the competence of the few non-official Co-operators who had volunteered for the work. I was convinced that the personnel indented for the Survey were most of them ignorant of even the elementary principles of family economy and that it was almost impossible for the Inspectors of Co-operative Societies to exercise any disciplinary control over them. I found myself in an extremely difficult position. It was realised that the commitments regarding the Economic Census had gone too far to justify the abandonment of the Scheme. The proposal had been too much in the public eye and the desirability and importance of the Survey had been commented on at great length by Newspapers. It had also attracted attention outside the State. Above all, Government had sanctioned the scheme and nearly ten lakhs of forms had already been printed. To proceed therefore straight ahead relying on the non-official agency would not have produced any satisfactory results as I was convinced that the statistics so collected would only yield a mass of unreliable, incoherent and often false information.

Adoption of Stratified Representative Sampling.

4. My views on this subject were submitted to the Dewan on 24-10-1940 when the Chief Secretary was also present. After a detailed discussion it was decided that the scheme of house to house survey on a census basis might be given up and my recommendation of a Survey on the Stratified Representative Sampling basis be adopted instead. I was also asked to prepare a list of 50 or 60 typical units in consultation with the Chief Secretary for conducting the Survey.

Its advantages.

5. The advantages of the Sample method over the Census method are discussed below but it will be obvious to every one that the margin of error in the Sampling method can be reduced to a minimum as there is the possibility of working the scheme with a controllable number of Investigators who could be given the necessary intensive training before they start on their work. There is thus the possibility of engaging for the work, people with the necessary academic qualification, experience and skill. Further for this scheme the estimated cost was less than Rs. 6,000 as against Rs. 10,000 originally proposed to be paid as allowances to the honorary Investigators.

The structure of the social machinery.

6. To appreciate correctly the advantages and efficiency of the Sampling method, it is necessary at the outset to view the problem in its proper statistical setting. Social structure is a complicated machinery steaming and knocking and pressing for a change of gear at every stage in its onward climb towards progress. Individuals constitute the innumerable parts in this mammoth

machine. Each individual contributes his mite, however little it may be, towards this onward drive. The momentum given by the individuals, when pooled together, becomes a living force that sometimes accelerates and at other times retards progress.

The family as convenient unit of study.

7. Progress, being the time integral of individual efforts in a group, can be analysed into its different components by studying the individuals at close range. Such a study will immediately reveal that the activities of the individual are mostly governed by and centre round a nucleus—the family. This is especially true in India. Thus, a correct sum-total of human effort towards progress can be struck only by an analysis of the family and the spur to exertion which the family demands from its component parts as conducive towards its progressive life.

The variables of family economy.

8. The forces underlying all activity in a family are partly intellectual, partly cultural and mostly economic. The balance between income and the sources of income on the one hand and expenditure under different items on the other, is the fundamental problem in family life. The factors to be taken into account in studying these two broad currents in social economy are highly variable from family to family and from one social group to another. But behind these apparently divergent elements, there could be observed certain characteristics that maintain more or less a constant level of values. The aggregate of such factors typical of the group is the analytic equivalent of the society under study. From a correct knowledge of their value, it is possible to build a model of the group or community.

The common group-factors.

9. The analytic structure of the society is given by the "Aggregate Regularity" existing in the group. In popular terms, this refers, to the set of characteristics common to the majority in the group. These group-factors have certain central values called parameters or indices. The characteristics of the individuals in the group lie in the neighbourhood of these parameters. The evaluation of these constants and their comparison with different groups will thus constitute the analytic study of society.

The need for their accurate measurement.

10. The analytic study of mass phenomena is best effected through statistics. The data to be analysed consist of information that is collected from the individuals constituting the group, technically called population. The results of the analysis will always depend upon the accuracy of the data. The method of analysis is strictly mathematical and the tools provided for this are sufficiently sensitive and sharp. In this connection it will be out of place to go into the theory of statistical method ; but a word as to the exact method of collecting the data required is necessary, so that the limitations in the study might be borne in mind when conclusions are arrived at and their correctness estimated.

Difficulties of the Census method.

11. There are two methods of collecting data. These are (i) the Census method and (ii) the Sampling method. The Census method lies in observing every individual in the group, while the Sampling method takes into account only a few individuals in the group as types or samples. To ensure accuracy, the sample generally should not be too small. It will be observed that the Census

method, in spite of its apparently thorough and exhaustive nature has its disadvantages. First and foremost, the machinery that has to be engaged in the actual collection of the data is rather unwieldy and complicated. This will introduce a large element of error in the data collected since it will not be possible for the Investigators to maintain complete homogeneity in the standards. The problem of supervision will also be a difficult one. The lack of perfect control and the consequent mistakes in enumeration will, to a large extent, easily mar the theoretic accuracy of the Census method.

Greater exactness of the Sample method.

12. The Sampling method on the other hand, takes into account only a few individuals that cover a comparatively small proportion of the total population. Consequently, the number of Investigators required for the collection of data will not be large. The source of error on this account is therefore minimised and the practicability of strict supervision still further reduces the margin of error. The theory of sampling has been subjected to special study by mathematical Statisticians and their researches have conclusively proved that this method is perfectly sound in its application to social phenomena. In view therefore of the greater exactness ensured by the sampling method, the Census method may be regarded as too primitive for scientific inference.

The technique of Sampling.

13. The technique of sampling depends upon the nature of the population under study. In a homogeneous population, the set of parameters showing the central indices has only one set of values while in a heterogeneous population the parameters may not have definite values or may possess more than one set of values. For example, the labourers in the State, engaged in manual work, may be getting a daily wage of about 6 annas per head and in this respect form a homogeneous population in which the value of the parameter corresponding to the attribute—wage—is 6 annas. On the other hand, a population consisting of the primary school going pupils and college students is necessarily heterogeneous in respect of attributes like age, height, weight and equipment, that are fundamental factors in an educational study.

Disadvantages of Random Sampling.

14. In the case of homogeneous populations, the best results are obtained by taking what may be called a Random Sample. Here the selection of the individuals is made with no bias ; each individual being given an equal chance of inclusion in the sample. But in the study of heterogeneous groups, the method is entirely different. We may look upon such a population as a mixture of homogeneous populations and hence the sample chosen has to give information regarding each of the component homogeneous groups. The Random Sample may possibly omit individuals from the several component parts or may give only incomplete details regarding the structure of the population. Hence the analysis based on the Random Sample will give an entirely distorted picture of the whole. Thus, in the study of heterogeneous populations, the technique of sampling has to be so adjusted as to comprehend within its scope units from every one of the different types that constitute the composite group. This is achieved by what is known as the Stratified Representative Sampling Method.

15. According to this, the population is first divided into different strata each of which will form a homogeneous group and from each stratum so obtained, a representative sample is taken. In sociological and economic studies, where the units are men and women living in different environmental conditions, the Stratified Sample is best suited to furnish adequate data for an analytical study. In actual practice, the success of this method will depend upon the stratification of the population into homogeneous units. To be most practical and effective, the method presupposes an intimate knowledge of the life and environments of the people. A careful selection of centres based on this intimate knowledge alone will provide material for analysis to give the co-ordinates of the orientation in which the different communities live in the State.

Suitability of Stratified Representative Sampling.

16. For the Economic Survey of the State by this Stratified Representative Sampling method, the first item in field work was the careful selection of centres truly typical of the different strata or homogeneous groups. The thirty taluks into which the State is divided for administrative purposes fall under one or other of the three Natural Divisions, the Lowland, Midland and Highland. From each taluk the typical pakuthies or Karas selected comprised portions of the different natural regions covered by the taluk. The rural centres were chosen in consultation with the Tahsildars who had intimate knowledge of the locality and finally decided upon after a conference with the Chief Secretary. As for the urban area, the towns were classified into industrial towns, agricultural towns, market towns, temple towns and old urbanised areas and typical centres were selected from these. From the 17 Municipal towns centres were chosen on the same principle, a few wards of the City of Trivandrum being included likewise in the Survey. Care was also taken to see that as far as possible ten per cent. of the total number of occupied houses in the State were covered by the centres chosen. Thus the number of houses brought under the Survey comes to 1,00,059 which is nearly a tenth of the total number of occupied houses in the State. Appendix I gives in detail the area selected in each taluk, the natural region in which it is situated and the number of occupied houses in that area. The map given as frontispiece indicates the location of these centres.

The selection of centres.

17. Sanction of Government was received (in G. O. R. O. C. No. 539 of 40/Genl, dated 3rd January 1941) for the revised scheme for the conduct of the Economic Survey on a Stratified Representative Sampling basis in 55 selected centres, utilising the services of 200 full-time Investigators on an allowance of Rs. 15—20 per mensem, for a period of two months. The work in each centre was placed under the direct control of the Inspector or Liquidator of Co-operative Societies. The operations could not be started immediately as arrangements had to be made for the final census which was coming off in March 1941. The selection and training of the Investigators had to be postponed to a date after that.

Plan of field work.

18. The selection of the Investigators however proved by no means an easy task. For the population census an Enumerator with average ability would have sufficed as the data to be collected consisted of answers to direct questions on age, civil condition, means of livelihood, caste, religion literacy, etc. But the data for the Economic Survey depended upon the answers which could not be given off-hand so easily as the facts relating to one's age,

Difficulties of Investigation.

religion and civil condition. Even a person who kept correct accounts could not say off-hand how much he spent on food or clothing or education or how much he was able to save annually. The irritating inconvenience likely to be felt by individuals who had only recently been subjected to cross-examination by the Census Enumerators had also to be taken into account. Further, with regard to the large number of people who never bothered to keep accounts though returned as having a definite income, the Investigator had to use all his wits to extract the necessary details. As for the large majority returned as leading a hand-to-mouth existence, any direct attempt to find out their income was absolutely of no avail as many of them could not budget for even twenty-four hours. In these cases the Investigator had intelligently to deduce the income from their statements as to their daily or weekly expenditure. I have only very briefly touched upon the difficulties of the Investigator just to emphasise the need for great care and caution in selecting for this complicated and laborious work persons possessed of tact, sympathy, imagination and more than everything else, robust common sense and a capacity to do hard and sustained work. The remuneration proposed of Rs. 20 for Graduates and Rs. 15 for Undergraduates was not particularly attractive when weighed against the work which they had to do within the short span of two months. I was, however, able to get the required number of enthusiastic young men for this difficult task by rousing their spirit of self-sacrifice to bring out the best in them realising the importance of this great national work wherein they should consider it a privilege to have been permitted to play their part. I took particular care to see that young men with the requisite qualification were chosen from among those who belonged to the particular locality so that they could use their local influence to impress upon the people the importance of the Survey and help to remove the scare that it was a scheme for additional taxation or imposition of a war levy.

Selection of Investigators.

19. On my recommendation Government were pleased to sanction the appointment of Dr. U. Sivaraman Nair of the Mathematics Department of the Travancore University as my Statistical Adviser. Immediately after the final Census, *i. e.*, after March 1941, I was busy for a couple of weeks organising the Tabulation section and after that work was completed, I started on a tour to the different centres for the selection of Investigators and their training. Dr. Sivaraman Nair accompanied me during these tours. The Inspectors of Co-operative Societies had been informed by a circular to call for and receive applications from suitable candidates preferably those who held degrees or diplomas in Economics or Statistics, with the added proviso that they should, as far as possible, belong to the locality and be members of influential families so that their local knowledge and influence might stand them in good stead in collecting the varied information required according to the Schedule. The candidates were subjected to a written examination with a view to test their knowledge of the local economic conditions. This was followed by an interview at which questions were asked to find out the aptitude of each candidate for the work, and to ascertain if he possessed the necessary tact, initiative and judgment to elicit the numerous details required in the Schedule from the rich and the poor. In view of the fact that the success of the enquiry largely depended on the possibility of getting the right type of men as Investigators I myself conducted the written examination and interviewed the candidates, the best among them alone were picked out. The details are given in Appendix II.

20. After the selection of the requisite number of Investigators, the most difficult part of the work was to give them the necessary intensive training in their duties. This was done jointly by Dr. Sivaraman Nair and myself. First we tried to make use of the schedule already printed which, however, was not found to serve the purpose, as there was the physical difficulty of using one of foolscap size where the printing was done on all the four pages. The material used being thin badami paper, it was not possible to enter the details on all the four sides as the writing would have become rather indistinct. To use pencil was almost impossible as the figures would fade by the time tabulation stage was reached. To write it in ink would be impracticable on account of the thinness and the coarseness of the paper. Further it was found from experience that there would be overlapping if every item in the schedule was filled up. For example there would be repetition of reference to the same lands under different categories as free holds, lease holds, etc. In the circumstances we were compelled to give up this elaborate schedule and prepare instead a Key Schedule. The Schedule is printed as Appendix III.

Replacement of the original enumeration sheet by the Key Schedule.

21. The Key Schedule replaces the ordinary enumeration card on which are printed the various details regarding the data to be collected. In the Key Schedule the different items of information are classified into a number of groups, each item corresponding to a code number. The enumerator, after some practice, gets by heart the code numbers corresponding to each item of the required information. Thus in entering the details in the enumeration pad the code number easily displaces the printed questionnaire. This device is obviously more economic the number of such schedules to be printed being not more than 400 for use of the field staff and later on for the tabulation section in the Office. For these reasons the schedule has been named the 'Key-Schedule'. In framing the Key Schedule one has to face the fundamental problem regarding family economy—the correct demarcation of the different sources of income and channels of expenditure. The items interrelated to these two have been classified into 12 sections from A to L, grouped under five main categories. Section A deals with the composition of the family. Sections B to E are designed to elicit the requisite details regarding sources of income. Details of expenditure are enumerated in Sections F to J. Section K deals with the question of indebtedness, while L pertains to agricultural produce from land cultivated by the family.

Scheme of the Key Schedule.

22. The scheme of the Key Schedule described above contains therefore only the most important, relevant and measurable factors of income and expenditure in the family. In preparing it great care has been taken to avoid overlapping of any kind in recording the sources of either income or expenditure. Further, detailed instructions were given to the Investigators as to the nature of the entries to be made under each head. Care was also taken to make the questions short, clear and unambiguous. It was likewise arranged to eschew verbal elaboration in making entries of the data required. To most of the questions the answers could be entered in figures.

Special merits of the Key Schedule.

23. The most difficult work of explaining the schedule to the Investigators and instructing them to enter the data under proper headings was taken up by Dr. Sivaraman Nair. They were asked to fill up a few schedules in our presence and these were checked before they were allowed formally to

Training of Investigators.

start the investigation. The Assistant Charge Superintendents had also to be given the necessary training to enable them to check effectively the work of the Investigators under them. The training of the Investigators in the different centres started on 12-3-1941 and was completed on 4-5-1941.

The conduct of field work.

24. To save cost the surplus enumeration cards of the population census were made use of. There was sufficient space on the blank side of each card for entering the necessary details as the code numbers replaced the lengthy headings of the questionnaire. The use of these cards also facilitated sorting as the pigeon-holed tables of the population census came in handy for this purpose. This effected a great saving in expenditure. If cards had to be specially printed for entering the details of over one lakh of houses as was done in other places—the Punjab and Bengal—the cost would have been prohibitive. To save time the Survey was not started simultaneously but as each batch was trained they were told off to proceed with the investigation. Two months were allotted for the whole survey and the Investigators were assigned on the average 600 houses each. The number may appear too large, but on account of the intimate knowledge the Investigators had of the locality it was possible for them to complete on the average 10 houses a day. The whole work was finished by the middle of July 1941. In the course of the work an intensive inspection was conducted of every centre to see if things were proceeding on right lines. Almost every card came under the scrutiny of Dr. Sivaraman Nair or myself and the necessary instructions were issued then and there. On the completion of the operations, the Investigators were asked to submit a short account of their work making particular mention of the economic condition of the area they surveyed and the outstanding features which deserved mention. The fairly satisfactory reports I received confirmed my belief that the Investigators had taken to their task in real earnest and made an intelligent recording of the economic conditions of the locality.

Tabulation.

25. The sorting and examination of the data commenced on 15-7-1941. The Sorters and Supervisors were selected from among the Investigators who had done the field work. This proved immensely helpful as the rather difficult task of extracting the requisite details for the analytic study attempted would not have been easy if raw hands had been selected for the purpose and further, such a selection was a special mark of recognition. The processes which the enumeration cards have gone through before they were compiled into the final tables, require some elaboration. A special feature noticeable in the present case is the fact that whereas in the population census the details entered in the cards required only a simple sorting before they were compiled into the final tables, in the Economic Survey each table is the result of extraction. Details had to be drawn out and moulded by the necessary statistical processes into the analytic model of the group. A process of careful selection and assembling has to be done in the construction of the Tables. Enormous amount of slip-copying also would have become necessary if the method of sorting in the population census had been adopted for the Economic Survey. Besides, the considerable delay and heavy expenditure involved, this process would undoubtedly have introduced inaccuracies making it impossible for the column totals to tally. Such inaccuracies and adjustments in the population census may not materially affect the tables, as the numbers involved run into millions. But in a Survey on the sampling

basis there is very little room for omissions or adjustments of any kind as the numbers become appreciably small due to purposive selection and successive stratification. This point will be clear from the scheme adopted for extracting Table I.

Basis of extraction.

26. The total number of families under investigation has, in the first instance, to be sub-divided regionally (Lowland, Midland, Highland and Urban area) then each original group has to be sub-divided into the major communities, which will have to be further sub-divided into the eleven income groups. Thus the one hundred thousand odd families will get split up into small units when the size of the group dwindles into one of 3 or 4 digits. The stratification becomes more and more pronounced by the further dwindling of the units in the succeeding tables. The tables have been designed with two objectives in view :

(i) To the intelligent and the interested reader each table should reveal the cardinal points in full detail without comment or explanation ;

(ii) Each table should contribute as a result of Statistical Analysis its share towards the construction of the analytic model of the community or the group of communities.

The latter objective serves to give a pen-picture without its being a caricature of the community. The first on the other hand, gives access to a microscopic study of any or every section of the group. Thus in Table IX—Distribution of families according to purpose of debt one has only to look at the figures in the bottom line to have an idea of the extent and purpose of the debt in several families in the State. If, however, further details are required one may look at the four row totals corresponding to the four main strata. Here one will easily find that in the lower income groups, family expense for food is the dominant cause of debt and as the income increases, social and other demands figure as the predominant causes of debt to the family. In this way it is possible to scan each table and make inferences regarding the different items, without calculations of an intricate nature. The tables bring out the following points in the economy of family life in the State :

(i) Distribution of families by community in the different income-groups (Table I)
(ii) Wealth of landed property (Table IV)
(iii) Main occupations (Table VI)
(iv) Extent and purpose of Indebtedness (Tables VII and VIII)
(v) Family Budget (Tables II and XI)

The first ten tables refer to all the families brought under the Survey whereas in Table XI types alone are given.

Method of Tabulation.

27. In the preparation of these Tables, the work was made more efficient as pointed out above, by the Investigators themselves being appointed to do the sorting. The cards received in the office were from the beginning, kept in four lots corresponding to the four strata, the Lowland, the Midland, the Highland and Urban area ; the cards of each stratum being arranged by Karas. The first stage in the preparation of the Tables was a preliminary extraction of the more fundamental details for each family, like total income, expenditure on food, tax, etc. These details had to be filled

in, after the necessary calculation on the figures against certain others. These were entered in blank cards attached to the set of cards pertaining to the family. The cards were then sorted according to the major communities. The cards after this sorting were bundled together for each Kara. Those corresponding to each community were then sorted into income-groups. The results of these two stages in sorting are contained in Table I. For the remaining Tables, the division of the family cards in Table I *viz.*, three-way stratification, has been maintained throughout and the tables were prepared by the dot method of sorting.

Details of the Process.

28. To illustrate this method consider Table II—the size of the family. The table has taken into account, for each of the four strata, the following (i) Community, (ii) Income, (iii) Number of dependants in the family, (iv) Number of earning members. To sort out the cards according to these details, foolscap sheets of paper were ruled in to rows and columns; rows to represent the number of dependants and the columns for the number of earning members. In this way one sheet could contain about three income groups and three communities in each income group. The cards for a Kara were taken and the details in Section A of the Key Schedule were then entered by means of a dot in the appropriate cell of the sheet prepared. After all the cards for the Kara were thus disposed of, totalling was done by counting the number of dots after which the total number of families in each unit was compared with the number in Table I. This formed a check on the accuracy of sorting. In this way, all the families in the different Karas were sorted and finally the figures by Karas were totalled on the adding machine to give Table II.

Preparation of Family Budget.

29. All the eleven tables bearing on this Survey were prepared in the manner described above. For Table XI an exhaustive compilation of the details in the family budget for several families was made and this recorded about five hundred families in each of the main communities for each section in the lower income groups. From these a selection was made to bring out types and the Table contains the result of this selection. The first enumeration was however utilised for the satistical analysis of the family budget.

Printing of Tables.

30. Each of the 11 Tables was sent to the Press as soon as it was completed, the first being on the 6th January 1942 and the last in parts between the 8th and 13th August. The printing of the first was completed on the 20th March and the last on the 12th December.

Expenditure of the Economic Survey.

31. It is difficult to separate the expenditure incurred in connection with the Economic Survey from that of the population census. The pay of the Census Commissioner, whose services were utilised for both, cannot be correctly allocated between what is due for each item of work separately. The office staff including the typists and machinists had likewise to be put on to both these items ; and the Clerk who was specially in charge of the Economic Survey was doing other items of work also. As regards the Survey separte accounts are available therefore only for the field and compilation staffs, and not for the office or supervisory staff. The amount for the separately available items of expenditure works up to Rs. 11,007-20-8 (exclusive of the pay of the Census Commissioner and of the Office hands that attended to the Economic Survey work in part) Calculated presumably on the same basis, the expenditure recorded for the Economic

Census of 1931 comes up to Rs. 28,440 and the results of that enquiry were published as an Appendix to the main Census Report, instead of as a separate Report with tables as is done this time.

Previous Enquiries into Economic Problem.

32. The last decade witnessed several special enquiries launched in the State with the object of obtaining first-hand information on such problems of economic importance as agricultural indebtedness, co-operation, economic depression, handloom and cottage industries and labour conditions, while similar investigations by expert committees had been undertaken prior to these on banking, unemployment, etc. The suggestions and recommendations embodied in the various reports on these questions have been immensely helpful, in the formulation of schemes for the economic betterment of the State. Each of these enquiries, being limited in its purpose had to be circumscribed in scope, confined as it was to a particular aspect of the economic life of the people, like a specialist called in to attend to one or other of the several parts of the human body. A unified and comprehensive enquiry that could reveal the mechanism behind the socio-economic structure of the body-politic has not so far been attempted. The 'Occupational' section of the population census report, interprets the occupational trends of the people as revealed by the statistics and presents a synoptic view of the economic condition of the State in general, including within its purview the results of the separate enquiries held within the decade preceding the decennial census integrated into the general study of broad questions on collective economy such as Agriculture, Industry, Trade, Credit facilities, Transport, Marketing, Economic planning, etc. The Report on the Population Census forms therefore both the repository of the various data supplied by the special economic enquiries of the last decade, as well as the background of the present Report which embodies the results of all economic activity as it affects each family particularly in relation to the income it derives from the different enterprises, expenditure incurred and their contribution to its assets and liabilities, etc. The population census immediately preceding the Economic Survey, also facilitates the striking of correlations between the data collected by both at each stage, thus interlinking this special enquiry with the general economic trends revealed by the study of population.

The principal feature of the present Report.

33. The present Report is an analytic survey of the economic life of the people in the State viewing, from different angles set in the Tables, the family economy of the different communities in different natural regions under the different income-groups. As has already been stated, the Tables themselves being self-explanatory and the study itself being analytic rather than descriptive, no lengthy disquisitions on the topics dealt with are called for. The Report centres round the Tables analysing them wherever necessary to elucidate a point or emphasise the fundamentals. Sufficient care has been taken to avoid vague generalisations, which often cloud the issue, so that the deductions may be made as precise as possible, each being based on definite statistical data scientifically derived and correlated. The survey is therefore more intensive than extensive.

INCOME.

A. Total Income.

Sources of Income.

34. The most important single determinant of the standard of living of a group or community is income. In assessing income the family is taken as the unit. The details of the Income of the family have been extracted from the enumeration card by the following procedure :

In the Key Schedule, the sources of income are grouped into four major categories :

i. Income from land (items 1 to 9)
ii. Income from Livestock (items 16 and 18)
iii. Income from professions, arts and crafts (items 17 and 21)
iv. Miscellaneous (items 10 to 15 and 19).

Against each of the items in the Key Schedule corresponding to the above four subdivisions, the enumerator was instructed to enter the total income without deducting the amounts expended. The income from the cultivation of food crops like rice, and money crops like cocoanut, pepper, rubber, etc., was calculated on the money value of these articles at the local market price at the time of the Survey.

Income from Land.

35. The ordinary family in Travancore directly or indirectly turns to land for its sustenance. The net return from land depends on the contract under which the family cultivates it. A concise classification of the different forms in which land is enjoyed has therefore to be made in assessing the Income from land. Section B of the Key Schedule bears upon the data regarding income from land. The headings—9 in number—are self—explanatory. The extent of land is recorded under two broad categories—dry and wet. The dry lands are generally gardens in which cocoanut, tapioca, ginger, pepper etc., are grown. Wet lands are mostly paddy fields. The total of the items 1 to 9 gives the gross income from land. Expenditure on cultivation, taxes, etc., entered against items 23 and 45 is deducted from this total to gets the net income.

Income from livestock, agricultural implements, etc.

36. The fragmentary character of the agricultural holding makes it often necessary for the individual cultivator to depend upon his more prosperous neighbour for the agricultural equipments. He takes on hire besides the agricultural implements, the team of oxen for ploughing, manure for crops, very often the seed for sowing, on loan, hire or purchase. These therefore form a supplementary source of income to the many families who can afford to make the initial investments for stocking these. In the water-logged areas, in addition to the above, the hire of pumping machinery and country boats brings in a good income in the same manner, Under this category has also been included incomes from cattle breeding, sheep farming, dairying, poultry, etc. Income from these sources has been entered under items 16 and 18.

Income from Professions Arts and Crafts.

37. Under this category are included income from such professions as of government servants, legal and medical practitioners, contractors, shop-keepers, artisans, handicraftsmen, etc. The income from these sources is entered against items 17 and 21 and the recurring expenditure involved in the pursuit of these professions is given against items 55, 56, and 57. From these two sets of entries the net income could be arrived at.

38. All items which are not included under the above three categories are brought under this group. Income derived by begging, by doing odd jobs, in kind, etc., are examples. Entry against items 10 to 15 and 19 specifies this source. Income from deposits, from chitties, etc., is also included in this.

Miscellaneous.

39. The total of the above four sub-groups is the total family income and its distribution is given in Table I. In this Table income has been classified into the following 15 groups:

Frequency distribution of Income.

1.	Income below or equal to Rs. 60.			
2.	Above Rs. 60	and below or	equal to	Rs. 120
3.	,, 120	,,		180
4.	,, 180	,,		300
5.	,, 300	,,		480
6.	,, 480	,,		840
7.	,, 840	,,		1200
8.	,, 1200	,,		1800
9.	,, 1800	,,		2400
10.	,, 2400	,,		3000
11.	,, 3000	,,		3600
12.	,, 3600	,,		4800
13.	,, 4800	,,		6000
14.	,, 6000	,,		8400
15.	,, 8400			

This classification has been adopted after a careful study of the expenditure of a few typical families with diverse professions and occupations in the different natural regions of the State. The lower income groups have been split up into small sub-divisions to include the large number of poor families in each. Had the grouping been in larger class intervals, the results of the analysis would not have been accurate enough.

The families in each income group have been classified under certain homogeneous communities. Such a classification is absolutely essential under the Sampling method to arrive at correct conclusions regarding the life of the people in the State under each income-group.

Families in the different income groups by homogeneous communities are further classified for the rural and urban areas separately, the former being again sub-divided into the three natural divisions of the State—Lowland, Midland and Highland. The estates in the Highland have not been included in the Survey. Thus Table I is a three way contingency Table.

40. Before making any deductions from this Table, it would be necessary to consider how far this Table is representative of the State. In the population census, the individual is taken as the unit, while in the economic survey the family is adopted as the unit. However in the housing statistics in the population census each commensal family has been taken as the unit in ascertaining the number of occupied houses in the State. The close correspondence between the figures derived from the economic survey and the population figures for occupied houses, as will be evident from the marginal table, leads to the conviction that the samples represent correctly the population, of the State.

Comparison with population figures.

Percentage distribution of occupied houses.

	Census figures	Sample figures
Lowland	38·15	39·37
Midland	45·92	42·03
Highland	5·01	6·81
Urban	10·92	11·79
Total	100·00	100·00

Quartiles for the State.

41. The table below gives the quartile distribution of family income for the State. In place of the arithmetic average supported by the standard deviation the median has been adopted to give the location parameter, the upper and lower quartiles serving to mark the limits of fluctuation in income. The table also gives figures for the four divisions.

Quartiles of income distribution.

	Lower quartile	Median	Upper quartile
	Rs.	Rs.	Rs.
STATE	66	102	171
Lowland	70	106	168
Midland	59	93	145
Highland	78	113	177
Urban area	87	148	303

42. This Table brings out the following points :

Inferences.

(i) For the State as a whole, the average annual income of a family, as determined by the median, is Rs. 102, the poorer families getting Rs. 66 and the slightly better class Rs. 171 as is evident from the quartiles.

(ii) The families in the urban area show a marked difference from the point of view of income. The median has gone up to Rs. 148, the lower quartile to Rs. 87 and the upper quartile to Rs. 303. In this respect, the families in the Highland and Lowland rank as second and third. The Midland comes last. The variations in income noticed in the different strata may be attributed to agricultural and occupational differences.

In the urban area the prevailing wages are definitely better, and, in addition a fairly good percentage of families depend directly or indirectly on Government employees. In the Highland, the better income in the family is accounted for by (a) the larger extent of agricultural holdings, (b) the better prices obtainable for agricultural produce like potatoes, garlic, etc for which they may claim almost a monopoly and (c) the physical fitness of the people enabling them to work harder so as to give a greater out-turn and thus earn better wages.

In the Lowland the progressive diminution in the extent of the agricultural holdings with the rapid rise in density of population and the slump in the price of cash-crops in the last few years have contributed to a very noticeable extent to the lowering of family income.

The low income in the Midland may be accounted for by the catastrophic fall in prices of pepper, rubber and other money-crops confined to the area. Though war conditions have improved the prices since, the effect had not made itself noticeable at the time of the Enquiry. This slump in prices has no doubt affected the Lowland also. But, as regards the rice and coconut of the lowland, the fluctuation in prices has not been so pronounced as in the case of the money-crops of the Midland which command a wider market.

Income levels for communities.

43. Having discussed the position of the family for the State as a whole, it will be interesting to go into the income levels for the individual communities. The Quartiles of family income for the main communities are given below.

Quartiles of income for communities.

Community	Lower Quartile	Median	Upper Quartile
	Rs.	Rs.	Rs.
All communities	**66**	**102**	**171**
Brahman	138	276	576
Nâyar	72	115	207
Ilava	62	96	139
Other Hindu	76	120	193
Backward Communities	57	85	124
Christrian	70	108	179
Muslim	66	102	171

This table brings out the distinctly high level of income in the Brahman community. The high income recorded for the Brahman community is due to the large number of Malayala Brahman Jenmies who come under this category and whose generally high income from land has been responsible for recording such high figures. The median for the State—Rs. 102—is comparable to the median incomes of all the communities except the Brahman whose median is over two and a half times that for the State. This high income level has not affected to any appreciable extent the general average for the State, as the Brahman community constitutes only 1·27 per cent of the total population of the State. Wherever reference is made to the Brahman it should be understood that the group includes the Malayala Brahmans (Nambudiri and Potti) also. The families belonging to the Nayar, Other Hindu and the Christian communities have better income levels than that for the State. The Muslim is just on a level with the State average whereas the Ilava and the Backward Communities lag behind.

Details of income distribution.

44. The income of the different communities may now be analysed in its different aspects. For a correct appreciation of the varying income levels, more details of the actual frequency distribution of income are necessary. The proportion of families in the different income-groups for the different communities is given in the following table.

Distribution of families according to Income.

(Percentage frequency)

Community	Income-group in Rupees							
	Below 60	60 to 120	120 to 180	180 to 300	300 to 480	480 to 840	Above 840	Total
All communities .	**20·5**	**39·1**	**18·1**	**12·9**	**5·2**	**2·7**	**1·7**	**100**
Brahman .	5·1	15·1	12·0	21·0	16·1	13·5	17·2	100
Nāyar .	18·3	33·6	18·3	15·4	7·9	4·1	2·4	100
Īlava .	23·5	42·8	18·0	10·4	3·2	1·3	0·8	100
Other Hindu .	15·6	34·8	21·7	15·5	7·1	3·5	1·8	100
Backward communities .	27·6	45·5	15·3	8·1	1·9	0·5	1·1	100
Christian .	18·1	38·8	18·8	13·7	5·6	3·2	1·8	100
Muslim .	20·3	39·1	18·1	12·9	5·2	2·7	1·8	100

A study of the distribution for the communities shows that for all communities except the Brahman, the Mode falls in the income-group 60—120. For the Brahman it is shifted to the group 180—300. The greatest number of families share the income corresponding to the respective Modal group and consequently the average family income is given by the Mode. This is in close agreement with the findings based on the median. The small percentage of families in the Brahman community in the lower income-groups explains the high income level in this community. The large proportion of families in the Backward communities in the lower income groups together with a small proportion in the higher income groups has brought down the family income for this group. The variations in the proportions of families in the different income groups are reflected in the income of the average family for the other communities and this accounts for the fluctuations noticeable in the increase in income of the several communities.

Coming to the three Natural Divisions and the Urban area, the family income for each community remains practically at the same level for the three Natural Divisions. Higher values are noticeable for the Urban area. The Table below gives the Quartile Distribution of family income for the different regions.

Quartiles of income for the four strata.

Community	Region											
	Lowland			Midland			Highland			Urban Area		
	L. Q.	M.	U. Q.	L. Q.	M.	U. Q.	L. Q.	M.	U. Q.	L. Q.	M.	U. Q.
Brahman .	128	238	468	158	318	600	No. of families too small			130	258	601
Nāyar .	76	121	207	61	100	173	78	119	199	102	188	390
Īlava .	67	100	150	54	77	119	73	108	168	61	97	151
Other Hindu .	74	112	174	65	106	165	89	134	237	99	156	268
Backward communities .	63	90	135	49	71	103	68	96	139	69	109	183
Christian .	32	118	188	63	94	153	76	116	181	101	174	384
Muslim .	74	111	186	74	111	168	75	110	172	75	126	232

The features noticed for the State as a whole in the different communities are once again seen in the four regions of the State. The relative prosperity of the communities is found to differ from one stratum to another. Thus the Brahman in the Midland, the Iḷava in the Highland and all the other communities in the urban area record the highest income.

45. Before taking up the analysis of income in greater detail, separately under each of the four different sources, an attempt may be made to assess the income per capita for the State. Economists are by no means unanimous regarding the definition of *per capita* income. *Per capita* income has been arrived at in different countries by different methods. The study of *per capita* income in the present scheme is based purely on the data made available by this survey. *Per capita* income for the State has been deduced from two different aspects taking into consideration (i) the earning members and (ii) all the members in the family. If it is possible to achieve this satisfactorily without being entangled in the maze of conflicting theories regarding the definition of *per capita* income and its measurement, the survey will have more than justified itself.

Income per capita.

46. As the family is taken as the unit of social and economic life, the income earned by the members of the family is pooled together. How far and to what extent these individual members in different age-groups varying in equipment and capacity contribute to the family purse eludes exact measurement. To the total material income of the family, only a few may contribute ; but the sum-total of satisfactions derived by the family is made up of the contributions, material and psychological of each one of the members in varying degrees. The inducement to earn more, to be able to spend more, to derive greater satisfaction is therefore a group character in the family. If the *per capita* income has to be calculated, this inducement, the component parts of which are partly material, partly psychological and partly everything, has to be given a measurable form. The method of factor analysis employed by psychologists may be adopted with advantage here. By this method it is possible to calculate certain conversion factors that may be used to reduce to a common denomination the individuals of varying equipment and capacity in the different age-groups. These constants may be called "adult equivalents". *Per capita* income may now be calculated by dividing the average income in the family by the average size in terms of its adult equivalent. This method of calculating *per capita* income may not be acceptable according to the strict canons of economic theory, but will meet a practical need for the work-a-day world.

i. Group factor.

47. To estimate *per capita* income of the earners, Table II has to be analysed to determine the position of the family as regards their number. The following table gives the results of this analysis.

ii. Earners.

Distribution of families according to the number of earners.

Income Group	Community	Number of earners					
		1	2	3	4 and above	Total	Average
Rs. 181—300	Brahman	80·7	13·2	4·4	1·7	100·0	1·27
	Nāyar	40·6	29·8	15·3	14·3	100·0	2·03
	Ilava	22·8	24·6	20·0	32·6	100·0	2·62
	Other Hindus	40·1	23·4	15·1	16·4	100·0	2·08
	Backward Communities	22·7	26·6	20·7	30·0	100·0	2·58
	Christian	33·6	30·9	17·5	18·0	100·0	2·20
	Muslim	32·0	26·0	16·6	25·4	100·0	2·35

Rs. 121 to 180	Brahman	81·6	12·8	4 1	1·5	100·0	1·26
	Nāyar	43·4	30·7	14·4	11 5	100·0	1·94
	Ilava	25·2	32·6	20·4	21·8	100·0	2·39
	Other Hindus	40·3	30·4	14·2	15·1	100·0	2·04
	Backward Communities	27·3	32·8	19·7	20·2	100·0	2·33
	Christian	33 4	34·5	16·4	15·7	100·0	2·14
	Muslim	35·6	29·9	16·8	17·7	100·0	2·17
	All Communities	**84 2**	**32·3**	**16·9**	**16·6**	**100 0**	**2·16**

From this table the average number of earners is calculated and with the help of the table (page 16) giving the distribution of income, the *per capita* income of the earners in a family has been determined. The table below gives the *per capita* income derived in this way.

Per capita income of earners

Community	Brahman	Nāyar	Iḷava	Other Hindus	Backward Communities	Christian	Muslim	All Communities
Lowland								
No. of earners in a family	1·31	1·87	2·17	1·91	2·17	2·01	2·02	2·03
Income Rs.	182	65	46	59	42	59	55	53
Midland								
No. of earners in a family	1·34	1·83	2·08	1·89	2·11	1·97	2·03	1·97
Income Rs.	237	55	37	57	34	48	55	47
Highland								
No. of earners in a family	..	1·82	2·23	1·95	2·19	2·01	2·03	2·04
Income Rs.	..	65	48	69	44	58	54	55
Urban Area								
No. of earners in a family	1·32	1·92	2·10	1·97	2·18	2·04	2·04	2·05
Income Rs.	195	98	46	79	50	85	62	72
State								
No. of earners in a family	1·32	1·85	2·14	1·92	2·14	1·99	2·03	2·01
Income Rs.	209	62	45	63	40	54	56	51

Index Numbers for per capita income of earners

	Brahman	Nāyar	Iḷava	Other Hindus	Backward Communities	Christian	Muslim	All Communities
Lowland	346	123	88	112	79	112	105	100
Midland	503	116	78	121	71	101	116	100
Highland	..	118	87	124	79	104	98	100
Urban	271	136	64	110	69	118	86	100
State	412	123	88	123	78	107	111	100

The average income of the earning member in the Brahman family is very much higher than that of any other community. The Iḷava and the Backward Communities fall below the State level. The other communities have slightly better records though the Muslim is lagging behind in the Highland and the Urban area. The low Index numbers for the Iḷava and the Backward Communities may largely be attributed to the low wages they get for their work and also the low prices obtained for their produce from cottage industry, probably for lack of proper marketing facilities.

48. To throw light on the *per capita* income taking into account all the members in the family, the size of the family reduced to the adult equivalent scale is taken from the family budget table (page 36) and with the help of the distribution of income (page 16) the average income of the individual in the family is calculated. The results are given in the table below.

iii. All members

Per capita income including non-earners

		Brahman	Nayar	Ilava	Other Hindus	Backward Communities	Christian	Muslim	All Communities
Lowland									
Size of family		3·91	3·80	3·91	3·55	3·65	3·85	3·76	3·79

State									
Size of family		4·08	3·78	3·88	3·66	3·63	3·78	3·78	3·76
Income	Rs.	68	30	25	33	23	29	27	27

Comparisons are made easier with the aid of following Table of Index Numbers taking figure for All Communities as base. This table confirms the conclusions arrived at earlier in regard to the *per capita* income of the earning members only. The figures naturally have dwindled down due to the inclusion of the non-earners.

Index Number of per capita income including non-earners

	Brahman	Nayar	Ilava	Other Hindus	Backward Communities	Christian	Muslim	All Communities
Lowland	218	114	91	113	88	110	106	100
Midland	305	107	81	122	79	100	116	100
Highland	..	106	86	118	87	105	102	100
Urban area	171	124	68	105	73	116	89	100
State	**249**	**112**	**91**	**121**	**86**	**105**	**99**	**100**

49. The index numbers for the Backward Communities and to a slight degree those for the Iḷavas have slightly improved in the second table. This is due to the fact that in the families for these two sections the number of non-earners is proportionately less than those in other sections. In the Brahman community there is a slight levelling down in the present table. This is due to the non-earners among them being comparatively more numerous than in the other sections. In the other communities, but for slight variations, the two sets of index numbers remain the same. It must however be remarked that for the Brahman the indices are much too high as compared with the others. The Iḷava and the Backward Communities record very low income levels. Among them though women and children also go to work the average return from labour falls since female as well as child labour is remunerated only at a very much lower rate than that of the adults who themselves get low wages.

iv. [Comparisons

The comparisons on the two sets of index numbers for per capita income, can be made more pointed with the help of the following table.

Per capita income per mensem

	Earners only		Including non-earners	
	Rs.	As.	Rs.	As.
All Communities	**4**	**4**	**2**	**4**
Brahman	17	7	5	11
Nāyar	5	3	2	8
Iḷava	3	12	2	1
Other Hindu	5	4	2	12
Backward Communities	3	5	1	15
Christian	4	8	2	8
Muslim	4	11	2	4

50. Though the figures for the number of earners and the size of the family may be placed side by side to give the extent of dependence of the latter on the former indirectly serving as an index of unemployment—the following table giving the proportion of families according to the number of dependants in the family will throw fuller light on the intensity of unemployment and the degree of dependence.

v. Burden on the earner.

Distribution of families according to number of dependants

Income Group.	Number of dependants								Average.
	Nil	1	2	3	4	5	Above 5	Total	
Rs.									
Below 60	18·5	20·3	21·3	17·1	11·3	3·9	5·6	100	2·22
61—120	8·7	15·2	19·4	19·8	15·8	10·4	10·7	100	2·93
121—180	5·6	11·0	16·7	18·8	17·3	13·2	17·4	100	3·40
181—300	4·1	8·7	13·7	17·2	16·7	15·4	24·2	100	3·77
301—480	3·4	6·2	10·8	15·8	15·0	14·6	34·2	100	4·18
481—840	2·9	5·9	8 4	12·2	15·3	13·5	41·8	100	4·39

The number of dependants increases with income and naturally the tendency revealed is that unemployment is found to get more and more acute with increase in income as this character is shared in common by all the communities a separate analysis of the figures for individual communities is not called for.

B. Income from land.

Extent of agricultural plots.

51. The discussion made on family income may now be diverted to a study of the correlations between the several factors that directly or indirectly influence family income. Travancore is essentially an agricultural country and hence a reasonable beginning may be made by a study of the land under cultivation. Table III gives the number of separate plots of varying extent cultivated by a family. The area of each plot has been calculated after deducting the space taken up for house-sites so as to give the net cultivated area. The plots have been divided into 11 groups according to area. The table has been prepared from the data available from items 1, 5 and 6 of the Key Schedule. Dryland and wetland have been grouped separately for the three Natural Divisions and the Urban Area.

The table below gives the quartile distribution of extent of agricultural plots.

Quartiles of the Distribution of Agricultural Plots.

	Dry land			Wetland		
	Area in acres					
	Lower Quartile	Median	Upper Quartile	Lower Quartile	Median	Upper Quartile
STATE	**0·24**	**0·54**	**1·05**	**0·12**	**0·28**	**0·64**
Lowland	0·17	0·38	0·67	0·12	0·22	0·51
Midland	0·37	0·74	1 37	0·15	0·32	0·69
Highland	0·48	0·80	1·68	0·26	0·43	0·80
Urban area	0·20	0·48	0·98	0·24	0·56	1·50

For the State as a whole, the average extent of a plot of garden land is approximately 54 cents while the same for wet land is only 28 cents. This should not be confused with the *per capita* holding based on the total population. The comparatively small extent of an average agricultural plot is largely the result of family partition. The extent of the agricultural plot under wet land in all the Natural Divisions but not in the Urban area is very much smaller than that for the dryland. In attempting to find an explanation for this phenomenon, one has to go into the customs and conventions which disclose a traditional attachment to the paddy field. At the time of partition there is the urge to have in possession at least a small paddy field irrespective of its economic value. The members of ancient families or families of some standing abhor the idea of purchasing rice from the bazaar. This sentiment has necessitated the indiscriminate parcelling of wet land in almost all family partitions.

The upper and lower quartiles suggest that at best, the plots can go up to an acre and five cents of garden land and sixty four cents of wet land ; at worst, plots can be twenty four cents in dryland and twelve cents in wet land.

The conditions prevailing in the Natural Divisions will be evident from the table. The very low figures in the Lowland are probably due to the fact that the Nayars and the Ilavas who together constitute a good proportion of families in this area (16,183 families out of 39,389) have in the last decade effected partitions to the maximum extent.

52. So far it has been possible to estimate the average extent of the plot (wet and dry) under cultivation in the different Natural regions. An idea of income from land may be gathered from a careful study of Table X (income from main crops). The following table (a) gives the quartile distribution income from the main crops in the three different regions and table (b) the same for the other crops. In Table (a) the Highland is omitted as the main crops of this region viz., tea coffee and cardamom cultivated on a plantation scale have not been brought under the survey.

Agricultural produce.

Even in the natural regions, the variations in price level are so considerable that the median wealth for the family will serve only to give a very crude approximation to the corresponding extent of land. Hence this table should be compared with the table (page 22) on extent of landed property bearing in mind the limitation that the differing price levels make it difficult to arrive at any uniform correlation between the extent and wealth of landed property.

An interesting feature noticeable from the table is that families in higher income groups in Urban areas do not show any marked tendency to invest their savings on land. The wealth of landed property in the Midland families is definitely the highest, with the Lowland families coming second and then in the Highland ranking third. For a correct appraisal of this phenomenon, one has to go into the several factors that induce investments on land The price of land together with the corresponding return is perhaps the most important of these. In general land value is at its maximum in the urban area ; but the return from land is not correspondingly high except in cases where the investments are on buildings. The unearned increment is a factor that materialises only at the time of a future sale. This probably explains the comparative diminution of investments on landed property in the Urban areas.

Coming to the three natural regions, the population Census has revealed that the density of population is highest in the Lowland, next in the Midland and least in the Highland. One can therefore naturally expect the price of land in these three regions to vary in a similar manner the highest in the Lowland, next in the Midland and least in the Highland. The cultivation in the Highland being on the estate scale, is not possible for the average family, but only for those who have sufficient capital. Hence in spite of the low land value in this region, one finds that the average family has only comparatively small investments on land here.

56. The distribution of wealth of landed property among the different communites will be evident from the table below.

Quartiles for communities.

Quartiles of the distribution of wealth of landed property for communities.

Income		Brahman	Nayar	Ilava	Other Hindus	Backward Communities	Christian	Muslim	All communities
		Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.

	UQ	5,750	6,800	4,690	6,350	5,100	6,150	4,645	6,140

53. The tables give the relative importance of the different crops from the point of view of income to the family. These figures cannot however be compiled to give indices of productivity of the land. Only crop-cutting experiments conducted on an intensive scale, can furnish the necessary data for this purpose. The table gives a bird's eye-view of the income to the family from the different items of cultivation undertaken by it.

Wealth of landed property.

The wealth that the family has by way of landed property may next be considered. Table IV gives the distribution of families according to wealth of landed property. In preparing this table, the amounts entered as value for items 1 to 9 of the Key Schedule have been totalled and the figure so arrived at has been taken as the wealth of landed property belonging to the family. The price of a plot of land has been estimated on the basis of the price current in the locality at the time of the investigation. The value as per document is only nominal as the registration may have been done years ago when land value was rather low. Even in the case of the deeds executed in recent years, the custom of pricing the land low to save stamp duty is so common that the deed value of a piece of land rarely serves as a correct measure of the land value.

54. The following table gives the quartiles of the distribution of wealth of landed property for the four regions of the State.

Quartiles for the strata.

Quartiles of the distribution of wealth of landed property for the four strata

Income Group		Lowland	Midland	Highland	Urban Areas
		Rs.	Rs.	Rs.	Rs.
Below Rs. 60	Lower Quartile	85	44	40	84
	Median	152	82	75	176
	Upper Quartile	303	220	212	432
60— 120	Lower Quartile	96	88	80	103
	Median	160	184	144	200
	Upper Quartile	452	336	319	470
120— 180	Lower Quartile	135	180	135	150
	Median	237	370	230	247
	Upper Quartile	795	570	550	770
180— 300	Lower Quartile	375	400	300	380
	Median	760	790	500	730
	Upper Quartile	1,500	1,450	1,200	1,350
300— 480	Lower Quartile	730	830	780	630
	Median	1,260	1,420	1,220	1,140
	Upper Quartile	2,750	2,450	2,480	2,570
480— 840	Lower Quartile	1,720	2,100	1,690	1,540
	Median	3,530	3,740	3,320	2,680
	Upper Quartile	6,790	7,540	5,200	4,880
840—1200	Lower Quartile	2,700	3,050	3,100	2,250
	Median	6,600	6,000	5,500	3,350
	Upper Quartile	13,100	9,800	8,350	6,700
1200—1300	Lower Quartile	3,250	7,700	6,850	3,700
	Median	7,250	14,250	13,600	6,000
	Upper Quartile	21,100	22,400	21,400	12,850

55. The differences in the value of land in the different natural regions of the State are so great that averages for the State as a whole will have very little practical importance. Hence in the above Table, calculations for the whole State have not been attempted.

Inferences.

57. In the lower income groups the Brahman has practically no investments on land. Among the other communities in the low income groups, the Nāyar ranks highest with the Muslim and the Backward Communities coming last. The Christians and the Other Hindus come between these two. These differences gradually vanish in the higher income groups though the Īḷava and the Muslim and the Backward Communities still lag behind. The ranking of the Nayar community with regard to wealth of landed property in the lower income groups is not kept up in the higher income groups. In the 300 and above groups they are slowly coming down to the level of the other communities. The family partition after the Nāyar Act of 1101 has released the craving for individual ownership which lay dormant before the Act came into force. Sub-division and fragmentation were the immediate results and these account for their high ranking in the low income groups and their parity with the rest in the higher income groups. Even this seems to be only a transition stage as it is found that these fragmented units are being fast sold out to other communities particularly to the Brahman and the Christian (Vide Tables on Distribution of sale by community—in the Fragmentation of Holdings Enquiry Report.). The Backward communities who are the tillers of the soil find it easy to purchase small plots with their small surplus from their erstwhile Nāyar landlords. The facilities provided by Government for the registration of puduval lands, the cultural awakening in them due to intense propaganda carried on by their leaders and their craving for economic independence have largely contributed to their gradual elevation from mere tillers of the soil to peasant proprietors. The quartiles given above will make this point clear. This is indeed a healthy change in a purely agricultural country where absentee landlordism has already caused great havoc to agriculture not to mention the social degradation of the hardworking agricultural labourers. May we hope that this is the beginning of an age in which the increase in peasant proprietorship will bring with it increase in the yield and secure for the State an economically independent yeomanry which should form the backbone of an essentially agricultural country. The population Census however points out that this movement is not so widespread as the number of cultivating owners has dwindled, leading thereby (vide Census Report 1941) to the conclusion that land is progressively getting under the control of the capitalists.

Inferences.

58. The above tendencies are further emphasised by a study of land tax paid by the several communities. The table below gives the quartiles of the distribution of land-tax in the different income groups.

Land tax.

	All Communities	5	9	10	8	11	9	45	10	11

In the lower income groups very few Brahmans are found to pay land tax. The Nāyar gives the maximum land tax, the Christian and other Hindus coming next. In the slightly higher income groups the Brahman and Other Hindus gradually displace the other communities, the Nāyar and the Christian coming almost on an equal footing followed by Īlava and the Muslim. The tendencies pointed out in the earlier section regarding gradual disappearance of ownership of land are thus confirmed by the data regarding land tax paid by individual communities.

59 The following table gives the proportion (percentage) of families paying no land tax

No Tax

Proportion of families paying no land tax

Region	Community	Below Rs. 60	Rs. 60—120	Rs. 121—180	Rs. 181—300	Rs. 301—480	Rs. 481—840

C Income from Occupations.

60. In the previous sections, the income from land has been analysed from different points of view. It now remains to consider the distribution of families according to the main occupation. The analysis by communities and income groups will disclose the extent to which each community in a particular income group depends upon one or other of the occupations as the main source of their income.

Occupations classified

The main occupations have been classified into ;

i. Landlord
ii. Agricultural labour
iii. Industrial labour (handicrafts, cottage industry. etc.)
iv. Trade.
v. Government service.
vi. Non-Government service
vii. Religion
viii. Others (miscellaneous and unspecified).

61. Table VI gives full details regarding the occupational distribution of the families by income group, community and natural division. For comparative study the several occupations have however been grouped into the eight main divisions specified above. For each community, the percentage of families under one or other of the eight categories is given in the following table.

Occupational Distribution of families

Percentage distribution of families in different occupational groups

Income	Community	Landlord	Agricultural labour	Industrial labour	Trade	Government service	Non-Government service	Religion	Others	Total
Below Rs. 60	Brahman	Number of families too small								
	Nāyar	20	57	5	7	1	1	1	8	100

	All Communities	28	6	4	20	20	15	2	5	100

Occupational Trends

62. For the State as a whole the dominant feature revealed is that the large majority of families derive their income from agricultural labour. The cheapness of labour in the State is the inference that could naturally be drawn by correlating the low income in the families with the high percentage of the number dependent on this source for their sustenance. In the income-groups above Rs. 300 trade, Government service and non-Government service and landownership more or less stand on a par as sources of income. The percentage of families engaged in industrial labour, landownership, trade and miscellaneous and religion is very low in the lowest income groups.

Extending the analysis to the different communities it will be evident that the Īḻava and the Backward Communities figure prominently as agricultural labourers, with the Nāyar, Christian and Muslim coming a close second. In the income-groups above Rs. 180 the Nāyar, Christian and the Muslim recede to the background, Other Hindus, consisting largely of the artisan class, occupying an intermediate position. The Brahman does not figure in this category at all. Under industrial labour in the lowest income group the Īḻava leads, Other Hindus,

Christian, Nāyars, Muslim and Backward Communities following next in order. In all other income-groups the Īlava, Other Hindus and Backward Communities register a higher percentage, than the other communities. The Christian follows them standing higher than the Muslim and the Nāyars. The percentage of 13 recorded by the Brahman in the income-group Rs. 60 to 120 is due to his pursuit of occupations like dairying, domestic service like cooking, etc., and not industrial labour proper.

In trade, the Muslim easily predominates in all the income groups. The relative position of the other communities varies in the different income groups. But the Īḷava and Christian in general take a slightly higher rank than the rest.

As regards Government service the Brahman takes the lead in all income groups. This feature becomes more and more prominent with increasing income. The Nāyar comes next, his percentage however being very much lower than that of the Brahman except in the Rs. 301 to Rs. 450 group where there is a parity. The other communities have not recorded any appreciable percentage in the lower income groups. They show improvements in percentage in the higher income-groups.

The other occupations call for little comment except that in the category of religion the Brahman who are a priestly class record a high percentage for obvious reasons.

EXPENDITURE.

A. General.

63. The next aspect of the study may be directed to a measurement of the sum total of the material and cultural comfort enjoyed by the family as revealed by the analysis of its expenditure. The progress of a community is gauged by the standard of living of families forming the group. A precise definition of standard of living is hard to formulate. Some economists associate standard of living with the total income—money-income plus income in kind. How far this is measurable is an open question. Others find the essence of standard of living not in the consumption of any particular goods or services—but in the maintenance of a given level of well-being which may be provided by various combinations of goods and services.

Standard of living.

The conditions in almost all countries are such that goods and services available to the family or the individual are not completely measurable. In India the condition is worse. The inter-dependence of families, the large extent of gifts in kind, the cultural and social services particularly those that relate to health, education and recreation make the exact evaluation in terms of money of the consumption of goods and services almost impossible.

64. Income no doubt is the most important determinant of the standard of living. But it is a study of how the family adjusts its income to meet its economic wants—in other words a study of expenditure as revealed by the family budget—that provides a more realistic basis for setting up indices of standard of living in the community. This procedure therefore presents an analytic picture of the economic position of the family in different income levels.

Family Budget.

65. Table XI gives types of family budgets in different communities in different income groups. The families in the higher income groups have been omitted for several reasons. The number of such families in the different communities is comparatively small, the families commanding income higher than Rs. 840 forming only 1·7 per cent. of the total number under investigation. Even in the case of such families enumerated in the survey, the details called for have been given only with the utmost reserve and in some instances with utter indifference to accuracy. Moreover, as has been stated already, the median income for the whole State centres round Rs. 102 and even the upper quartile—Rs. 171 falls far below Rs. 840. Hence the analysis has been taken up only for those in the income levels up to Rs. 840.

Scope.

66. At the very outset the principles underlying the analysis of the family budget may be set forth in some detail. To get at the correct perspective, the data collected have to be so analysed as to focus attention on (i) the composition of the family and (ii) the expenditure on the essential items in the family economy.

67. As regards the first—the composition of the family—the necessary details are furnished in the Key Schedule under 'Inmates' classified as follows :—

Composition of the family.

1. Under 3 years of age
2. Age 4—9
3. Age 10—17
4. Adult

In each group the male and the female have been entered separately. The above classification generally conforms to the common conventions observed in ordinary households. The child under the direct eye of the mother falls under the first category. The second group corresponds to the primary school going stage and the third to the higher stage of school instruction, or, in cases of poorer folk, to the group going in for manual labour. The classification therefore makes for unity within each group.

68. The expenditure in a family will necessarily depend upon its size. For instituting comparisons and setting up standards, the size of the family requires definition. It will be clear that the number of persons in the family in the different age-groups cannot be an adequate measure of its size in the sense that each is a consuming unit. A child in the arms of the mother in a poor man's family shares only a very small fraction of the expenditure that may be the quota of an adult. Probably in the rich man's household, the child forms a unit consuming much more than an adult. As such a more useful and reasonable way of determining the size is to give weights to the individuals in the family according to the expenditure incurred by the individual.

Size of family.

69. Several methods of weighing to reduce the individuals to what may be termed the adult equivalent are in vogue. The reduction based on the Lusk Scale is usually adopted. This scale has been prepared by taking into account the physiological necessaries in the individual and reducing them to a common denomination. How far this scale is applicable to conditions in India is questionable. Other methods taking into account the items of expenditure by each individual have also been worked out and applied to certain countries in Europe. The conditions in India are widely

Adult equivalent : i. Usual scales.

different from those in Europe so that such scales may prove inadequate. Hence it is necessary to prepare a scale of adult equivalents for the State based purely on figures available from the investigation.

70. We may formulate the problem in hand as follows: The members in the family in different age-groups form one set of variables and the expenditure on the more essential items in the family constitutes another. The analysis of family budget is essentially the study of these variables and their inter-relations. The analysis reduces itself therefore to the estimation of the correlations between the variables in each of the two sets and also the correlation between the two sets. The method of regression is one approach to this study. But in a complex study as the one in which the variables are connected with the machinery behind family life the method may yield only insufficient information. The method of canonical correlations adopted by Harold Hoteling has therefore been followed in this analysis.

ii. Scale adopted.

Based on this method, calculations were made for the different communities in different income groups. The results showed slight variations which however may be attributed to Sampling fluctuations. The following table gives the values of the adult equivalent obtained, the other values being only small variations from those tables.

Age-group.	Income less than Rs. 180.	Rs. 180—840.
Below 3	0·15	0·22
4 — 9	0·31	0·26
10—17	0·46	0·49
Adult female	0·83	0·97
Adult male	1·00	1·00

The low values for children below 9 reflect the helplessness of the family in providing even the minimum of amenities for the growing child. This becomes glaring when contrasted with the facilities provided for the welfare of the growing child in Western countries.

B. Details of the expenditure in the Family.

71. The scale of adult equivalents has been used in the analysis of the expenditure in the family. From Table XI, containing details of expenditure on different items, the following table has been calculated.

Expenditure analysed into different items.

Average expenditure per adult	**107·7**	**109·1**	**89·2**	**86·3**	**62·7**	**99·0**	**85·7**

This table may be looked at from the two different aspects mentioned in para 66 ;

i. The composition of the family, and

ii, The expenditure on the essential items.

Average size of family.

72. The size of the family shows considerable variations from one income group to the other, though within the same group the variation is not so pronounced.

The average size of the family is given below.

Income Group.	Size of family.
Below Rs. 60	2·94
60— 120	3·29
121—180	3·93
181—300	4·58
301—480	5·28
481—840	6·92

It is clear that the size of the family increases with income. This feature is noticeable to a larger extent in the 'Backward Communities, than in the others. Other Hindus, Īḷava, Christian, Muslim, Nāyar and the Brahman come next in rank. These remarks apply only to the average family with income not exceeding Rs. 70 a month. The conditions among the wealthier families cannot be judged on this basis. Probably it may be just the reverse—smaller families with increasing incomes.

Strength of family in broad categories.

73. Naturally the question arises as to why the size of the family should increase with increasing income in the lower income groups. The following table giving the average size of the family in three broad categories may serve to throw light on this question. (The figures have not been reduced to the adult equivalent scale.)

Average size of family in three broad categories.

		Below 60	60—120	121—180	181—300	301—480	481—840
Brahman	Below 17	No. of	1·34	2·39	2·46	3·42	3·44
	Adult female	families	1·09	1·71	1·59	1·58	2·83

	Adult female	1·18	1·18	1·48	1·76	2·14	2·84
	Adult male	0·89	1·34	1·33	2·07	2·24	2·73
Backward Communities					3·10	4·91	6·59
					2·02	2·91	4·18
					2·22	2·82	3·23
Pulaya	Below 17	3·18	2·72	2·78			
	Adult female	1·26	1·29	1·55			
	Adult male	1·25	1·49	1·73			
Paraya	Below 17	2·48	2·63	3·18			
	Adult female	1·27	1·38	1·50			
	Adult male	1·08	1·52	1·68			
Kurava	Below 17	2·89	3·09	2·87			
	Adult female	1·22	1·51	1·95			
	Adult male	1·06	1·59	1·75			
Christian	Below 17	3·01	2·86	3·60	4·05	3·92	4·78
	Adult female	1·21	1·35	1·37	1·58	1·76	2·23
	Adult male	1·12	1·32	1·60	1·63	1·97	2·37
Muslim	Below 17	3·25	3·18	3·42	3·72	4·75	4 75
	Adult female	1·22	1·22	1·42	1·53	1·45	2·68
	Adult male	1·07	1·40	1·31	1·87	1·59	2·80

The increase in the size of the family with increasing income in the lower income groups is also a noticeable feature in each of the broad categories of the classification according to age. The table also brings out some interesting facts regarding the composition of the family in the different communities. In the Brahman community, in all the income groups, there is a larger number of female than male adults. In the other communities the case is slightly different. This is easily explained. Economically the Brahman women are not ordinarily independent. Naturally the earning adult male has to support the non-earning female relative. There is also the non-prevalence of remarriage in this community which puts the widow under the protection of the son or some other male relative. Among the Nāyars and the Muslims, the female adult proponderates in the first three income groups while in the income groups above Rs. 300 the number of female adults is less. Among the Īḻavas and the Christians, except in the lowest income group, the number of male adults is all through greater than that of the female. In the Other Hindu communities, except in the income groups 60—120 and 180-300, the number of females is larger than that of males. Among the Backward communities which are essentially a working class, female adults exceed the males in the higher income groups. This general tendency is consistent with the progressive increase in the female-ratio as revealed by the population census.

Average expenditure per adult.

74. We now proceed to the expenditure in the family. The average expenditure per adult for all the communities is given below.

Income Group.	Average Expenditure.
Below Rs. 60	Rs. 18.1
60—120	32·3
121—180	38·8
181—300	51·4
301—480	70·5
481—840	91·4

These figures may well be taken as indices of standard of living for the State. They represent the money value of the sum total of the satisfactions enjoyed by the individual. Hence as indices they are more realistic of the life of the individual than other indices based on income only.

Position of communities.

75. The position of the individual communities in the several income groups may now be compared to the corresponding State level of standard of living. In the group below 60, the Other Hindus, Nāyar and the Muslim rank above the State level. In the income group between 60-180 the Brahman, Other Hindus, Christian and the Muslim have recorded better standards of living than those for the other communities. In the remaining income groups from 180 upwards, Other Hindus and Backward Communities gradually fall off to lower levels than the level for the State.

Thus on the whole the Brahman lives in comparatively greater comfort than any other community. The Christian and the Muslim also keep up the level for the State. The Nāyar is able to reach the level of the State only in the higher income groups. The condition of the Īḻava slightly improves with income. The Backward Communities however lag behind.

Expenditure under four main groups.

76. A detailed analysis of the family budget has already been given in the table (pages 34 and 35). The items of expenditure as disclosed by the family budget lend themselves to an analysis under four main heads, the individual items being too diffused for a comparative study.

1. The bare necessaries of life.
   Under this are included food, rent, clothing, light and fuel and washing.
2. Education.
3. Tobacco.
4. Other items.

The classification into these four main divisions requires explanation. It will be clear that every member of the family shares all the items in 1 and 4 in varying degrees according to age and hence the process of ascertaining the adult equivalent is most necessary here to estimate the per capita expenditure. It will be obvious that under 2 only those between 3 and 17 ordinarily come in as they constitute the school-going section of the family. Under 3, the adult males predominate with the adult female 'coming in' as a good second as she requires tobacco for chew though not for smoke. It will be clear from the above that any correct division of expenditure is possible only by this classification.

Per capita expenditure for each group.

77. The following table gives the results of this re-grouping. The per capita expenditure under each category is obtained by dividing the total expenditure for items in each, by size for (1) and (4), the total number between ages 4-17 for (2) and the total number of adults for (3). This method of striking the averages is therefore based on the realities of family life.

Per capita expenditure.

		Brahman	Nāyar	Ilava	Other Hindus	Pulaya	Parayan	Kurava	Christian	Muslim
Necessaries	Below Rs. 60	..	18	16	21	13	15	15	15	18

	301—480	2	3	3	3		5		3	4
	481—840	4	4	3	3		3		2	4
Other items	Below Rs. 60	..	1	1	..	1	1	..	1	1
	60—120	3	1	1	1	1	1	..	2	1
	121—180	2	2	1	2	2	1	1	2	2
	181—300	5	3	3	2		2		3	3
	301—480	6	4	4	3		3		4	6
	481—840	11	8	9	7		8		9	8

78. The above table presents a very harrowing picture of family economy. Taking into account the necessaries of life, which include food, clothing, light and fuel, and house rent, the expenditure for the Brahman varies from Rs. 42 to Rs. 88 per adult per annum. Even for this community that ranks first in the matter of income, the figures recorded are indeed poor. An adult gets only 2 to 4 As. per day for all the necessaries put together. For the other communities the corresponding figure varies between one anna and two annas for the Backward Communities and 1½ As. to 4 As. for the Nāyar. Consistent with conditions of living in Travancore, characterised by a simplicity almost spartan in character particularly in food and clothing, the pittance at the disposal of the individual as disclosed by the above figures points to the miserable life eked out from day to day. In this connection it may be pointed out that families getting income up to Rs. 840 constitute 98·3 per cent of the total number of families in the State, distributed as follows :—

Necessaries of life.

Income below 60	...	20·3 per cent.
120	...	59·4
180	...	77·5
300	...	90·5
480	...	95·6
840	...	98·3
Above 840	...	1·7

The sad picture revealed by this table is confirmed by the miserable housing condition disclosed by the population census wherein it is shown that 60 per cent of the population live in one or two-room houses and 85 per cent are members of households with 5 or more inmates.

79. For education in the lower income groups up to Rs. 180 practically no amount is provided by the Backward communities. Even amongst the others the expenditure is only very nominal. In the higher income groups the Nāyar, the Christian, the Brahman and the Īḻāva come in order in the amount spent per child on education. Other Hindus and Muslims stand on a par below the others.

Education.

In a State that ranks first in point of literacy, it may seem strange that the contribution from the people on the education of their children should be found to be so small. The reason is obvious, viz., in the family budget the margin left after meeting the cost of the barest necessaries of life is very small. This is, however, made up for by the progressive policy of the State which, from the beginning of the last century, has taken upon itself as its main duty to spend a substantial portion of the revenue on the education of its young. This has been literally supplemented by the heavy expenditure on education incurred by numerous private agencies as well.

80. Expenditure on tobacco forms no inconsiderable portion of the family budget. Analysing the figures by community, the Muslim is found to spend most on this item. The Backward Communities come next, followed by the Nāyar, the Īḻava, the Christian and the Other Hindus. The expenditure in this case is found to increase with increase in income levels. It is worthwhile to estimate the total amount spent by the people in the State on tobacco. This calculation can be made in view of the fact that 10 per cent of the families in the whole State have been brought

Tobacco.

under the survey and that the consumption of tobacco per family has also been calculated. The following figures give the annual expenditure on tobacco for the communities and the State:

	Rs.
Brahmans	98,000
Nayars	10,25,000
Ilavas	9,62,000
Other Hindus	4,16,000
Backward Communities	11,72,000
Christians	18,07,000
Muslims	5,25,000
Total	60,05,000

Miscellaneous.

81. This item comprises the expenses on ordinary social and religious ceremonies of a routine character and other items which could not be brought under any definite classification *e.g.* money spent on entertainments and recreations. The expenditure under this head is generally found to be comparatively very small. But as such the Brahman spends most, the other communities standing almost on a par.

Indices.

82. The problem of expenditure may be studied from the point of view of the proportion of its distribution under the various items in the different income groups. The indices of expenditure furnished by the following table will give a clear idea as to the intensity of the demand on the family purse made by each item of expenditure.

Indices of Expenditure.

Items	Brahman	Nayar	Ilava	Other Hindus	Pulaya	Paraya	Kurava	Christian	Muslim
Income Group : Below 60									
Necessaries of life	..	89·9	89·9	93·9	88·2	90·3	89·5	87·2	89·4

Income Group : 181—300									
Necessaries of life	86·7	83·9	86·4	91·0	..	89·3	..	85·5	88·6
Education	2·4	7·5	4·6	1·8	..	0·2	..	6·3	2·0
Miscellaneous	8·0	5·4	5·4	3·3	..	5·2	..	5·4	5·1
Tobacco	2·9	3·2	3·6	3·9	..	5·3	..	2·8	4·3
					Backward Communities				
Income Group : 301—480									
Necessaries of life	81·5	81·4	84·2	89·6		87·2		78·4	84·0
Education	9·3	10·8	7·2	3·b		0·5		13·5	5·1
Miscellaneous	6·9	4·9	5·9	3·8		5·2		5·5	7·4
Tobacco	2·3	2·9	2·7	3·1		7·1		2·6	3·5
Income Group : 481—840									
Necessaries of life	82·6	77·0	78·0	84·0		75·1		78·3	84·2
Education	4·8	13·0	9·9	3·8		9·1		9·7	3·1
Miscellaneous	9·9	7·5	9·9	9·4		11·9		9·4	9·0
Tobacco	2·7	2·5	2·2	2·8		3 9		2·6	3·7

The figures in the above table are self-explanatory. For example, a Muslim family in the income group Rs. 481—840 will spend according to this,

84·2 per cent of its income on necessaries
3·1 per cent ,, on education
9·0 per cent ,, on tobacco
3·7 per cent ,, on miscellaneous items.

It would be interesting to take note of a few of the general trends revealed by the table. In the case of all communities the proportion of expenditure on the necessaries of life is found to diminish with increasing levels of income while that on the miscellaneous items is found to increase. The proportion of expenditure on tobacco also tends to fall with increasing income in the case of all except the Brahman and the Backward Communities who keep up mostly the same proportion in all income groups. In regard to education, the proportion of expenditure is seen to rise with increasing income in the case of the Nāyar, the Christian and the Īḷava, the tendency being less manifest among the Brahmans.

INDEBTEDNESS.

Extent.

83. To strike the balance between income and expenditure, the following table giving the average expenditure in the family for four maior communities will be useful :

	Nāyar	Īḷava	Christian	Muslim
Expenditure in Rupees	167	131	160	165
Income in Rupees	115	96	108	102

Naturally the average family runs into debt. These figures are not the only indices towards the extent of indebtedness in the family. Obligations and commitments like repaymen t of loans already existing, encumbrances by way of lawsuits and similar other items make extent of family indebtedness very much more than what is revealed in the above table. The follo wing table gives the Quartiles of extent of indebtedness in the different income groups.

Quartiles of the extent of debt.

Income group.	Community	Lower Quartile.	Median (In Rupees.)	Upper Quartile.
Below Rs. 60.	Brahman		Number of families too small	
	Nāyar	15	50	69
	Īḷava	8	21	62
	Other Hindus	9	47	67
	Backward communities	4	8	23
	Christian	10	37	69
	Muslim	9	22	58
	All communities	8	26	66
Rs. 60—120	Brahman		Number of families too small	
	Nāyar	28	72	153
	Īḷava	11	35	87
	Other Hindus	17	47	114
	Backward communities	5	18	45
	Christian	14	42	104
	Muslim	16	45	123
	All Communities	14	42	107

Income group.	Community	Lower Quartile	Medium (In Rupees.)	Upper Quartile.
Rs. 121—180.	Brahman		Number of families too small	
	Nāyar	37	93	206
	Īlava	20	57	141
	Other Hindus	27	75	250

For families in the lower groups indebted to an extent of Rs. 200 or less, family expenditure is the main cause of the debt in all the communities. Other miscellaneous items of expenditure and investments and payment of prior debts are the next important causes for families running into debt. Families having debt to the extent of Rs. 200 and above payment of prior debts becomes the chief reason of indebtedness. Next in rank come investment and miscellaneous causes. Further social obligations also become an important factor.

85. The extent to which the families run into debt under each item is given by the quartiles in the following table.

Quartiles

Quartiles of extent of debt under different items.

Purpose of debt	Community	Lower Quartiles	Median (In Rupees)	Upper Quartiles
Social	Nāyar	50	128	361

	Muslim	23	70	251
	Others	21	56	191
	All communities	28	70	230

Clearly the poorer class of families alone figure in the table. Prior debts consume the largest amount, social requirements and investments coming next. Agriculture takes a fairly good share of the family indebtedness. Under the other categories like family expenditure and miscellaneous items figures in varying degree in the different communities.

Indebtedness of the Agriculturist.

86. The indebtedness of the agriculturists calls for some special comment. The following table gives the quartiles of the extent of indebtedness of the agriculturists of the State.

Quartiles of the extent of indebtedness of the agriculturists

	Lowland			Midland			Highland			Urban area		
	Lower Quartile	Median	Upper Quartile	Lower Quartile	Median	Upper Quartile	Lower Quartile	Median	Upper Quartile	Lower Quartile	Median	Upper Quartile
	(In Rupees)											
Below Rs. 60	27	94	245	38	80	148	40	62	122	23	52	102

481—840	113	427	1,285	196	640	1,584	62	167	565	97	167	735
841 & above	296	1,160	2,530	610	1,450	2,980	290	850	3,978	135	1,070	4,115

The Midland families in the higher income groups have run into debt to the largest extent, the Lowland, Urban area and Highland coming next in order. In the lower income groups, however, indebtedness is greatest in the Lowland. In the Urban area a slight increase is noticeable in indebtedness perhaps as the penalty they have to pay for absentee landlordism. The agriculturist in the lower income groups is not only forced to carry on an unremunerative profession as compared to his compeers in other fields of activity, but is burdened with a debt far heavier than theirs as will be clear from the following table.

	Below 60	60 to 120	121 to 180	181 to 300	301 to 480	481 to 840
i. Agricultural families	72	103	132	204	251	350
ii. All families	26	42	73	114	220	347

The inevitable conclusion is that his attachment to land outweighs all the lifelong sufferings he endures by the persistent harassment of the Creditor and the almost continuous semi-starvation of his unfortunate family. This is also substantiated by the facts revealed by the population census wherein are given details of the sad tale of the agricultural worker whose lack of organisation has been largely responsible for this economic degradation.

APPENDIX I – (*contd.*)

CENTRES SELECTED FOR THE ECONOMIC SURVEY

Urban areas.

S. No.	Type.	Total number of towns of the type in the State.	Total number of occupied houses in the type.	Area selected.	Number of occupied houses.
1	Industrial towns	4 Municipalities 3 Towns	19,684	48. Kayamkulam Municipality	1,843
2	Market towns	1 Municipality 1 Town	5,907	49. Pulavathu and Market Wards of Changanachery Municipality	760
3	Agricultural towns	5 Municipalities 18 Towns	36,422	50. Parassala, Chengannur, Thodupula and Minachil towns	3,708
4	Temple towns	1 Municipality 7 Towns	11,940	51. Ambalapula town	2,138
5	Old urbanised areas	2 Municipalities	5,500	52. C and D Wards of Attingal Municipality	539
6	Trivandrum City		21,704	53. Pettah A Ward, Puthenchanthai A Ward, Vellayambalam E Ward, Fort A Ward, Chalai C Ward and Manakkad A Ward	3,744 (4 Investigators)
7	Alleppey Municipality		9,047	54. Every tenth number of the number of occupied houses	905 (1 Investigator)
8	Nagercoil Municipality		12,350	55. Do. do. do.	

N B. For the City of Trivandrum and Nagercoil Municipality separate Assistant Charge Superintendents were appointed with the indicated number of investigators under them. In the case of other Towns and Municipalities the survey was conducted by the Assistant Charge Superintendents for the Taluks in which the Town or Municipality lies.

APPENDIX II.

TYPES OF QUESTIONS SET FOR THE SELECTION OF INVESTIGATORS

1. In a family of labourers earning their wages daily no accounts are kept as to expenditure. Frame six questions from which you can find out the amounts spent on food, clothing and other miscellaneous items per month. Consistent with the conditions in Nagercoil, enter the figures you can expect in the schedule supplied.
2. What is the approximate income a landlord can get from an acre of paddy land in Nanjanad. If he has four plots of land scattered about and having a total area of one acre, do you expect his income to increase or decrease? Give reasons.
3. It is required to find out the income of a landlord from the following items :
   (a) lands actually cultivated by him (Income Rs. 100)
   (b) land taken on pattom (Income Rs. 83)
   (c) land given on pattom for Rs. 75 (Income Rs. 144)
   (d) Cost of cultivation Rs. 53.
4. How would you elicit information regarding the expenses for food and clothing in a poor, middle and high class family where no accounts are kept ?
5. How would you ascertain the income of a poor family, when they have no definite trade or profession?
6. What methods would you adopt to ascertain the indebtedness of a poor agricultural family, the presumption being that no accounts are kept?
7. Differentiate between a Cottage Industry and a Large-scale Industry and mention the name of some industries which can be conducted on a cottage-scale with profit in Travancore.
8. Enter the following against their appropriate items in the Shedule form supplied.
   i. Amount received as Chitty amount Rs. 980/-
   ii. Amount invested for the Chitty Rs. 220/-
   iii. Vithapalisa gained Rs. 70/-
9. Select two pakuthies in Neyyattinkara which contain about 1/10 of the number of houses and which are typical of the taluk. State why the two pakuthies are selected by you ?
10. Fill up item C in the Schedule as it applies to any Cottage industry in your taluk ?
11. It is required to find the value of merchandise that come to Quilon Boat Jetty by country boats. Under what major headings would you classify these ?
12. Prepare a family budget for an average middle class family in Quilon town getting Rs. 75/- per mensem. The household consisting of two adult males, 3 adult females, a girl of 15 and a baby.
13. What are the conditions favouring the development of cashewnut industry in Quilon ? What would you think should be the living wages for a day labourer in (i) Quilon town, (ii) Quilon rural centres ? Give reasons.
14. Classify according to income and expenditure the following items.
   (a) A land taken on lease for Rs. 52 yields Rs. 117.
   (b) Three cows and four bullocks require Re. 1 per day for fodder. The price of milk sold comes to Rs. 35 and the bullocks given on hire fetch Rs. 25/- per month.
15. It is required to estimate the monthly expenditure in a family in which the members get daily wages. Frame six questions regarding the expenses on food, clothing, house rent and miscellaneous items.
16. A labourer in Alleppey gets 6 annas as wages per day. He has to support his mother, wife and three children. How will he distribute this amount for his daily needs ?
17. What scope is there in Alleppey for the employment of skilled labour? How much can a skilled workman who does not belong to Alleppey get per week as wages? Prepare a family budget for him. (His family consists of 1 adult male, 2 adult females? 1 girl of 16, 1 boy of 15 and a baby 3 weeks old.)
18. What raw materials are used for the Punalur Paper Mills ? From where are the raw materials got down? What are the daily wages paid for (i) ordinary labour, (2) skilled labour? Prepare a family budget for 1 and 2 presuming there are 2 adult males, 3 adult females, 2 children of 13 and 15 and 2 children below 10.
19. What are the main Agricultural products in Thiruvella and Changanachery taluks? What facilities exist in these places for marketing these ? Are any of these articles sold outside Travancore? If so, estimate the maximum price obtained for these
20. To what extent is it economically possible to substitute sugarcane to paddy cultivation in your taluk?
21. What are the important articles brought for sale to the Changanachery market and from where are these brought? Mention a few important items that find a ready sale in Changanachery market and what are their respective prices?
22. Do you note any fundamental difference in the standard of living of those other than estate coolies who live in the plains and those who live in any of the Pakuthies in Pirmede? Give reasons.
23. What do you think is the extent of an economic holding for a family in Pirmede consisting of two adult males, two adult females and three children under ten? Give reasons for your answer.
24. What articles other than tea and rubber are taken to the plains from Pirmede for sale? What articles of daily use are brought from the plains to Pirmede and how ?
25. What will be the annual income per acre of cocoanut garden in Vaikom taluk ? Note down the approximate expenditure that will have to be incurred annually for the above.
